# Addressing the mid-point of polymer chains for multiple functionalization purposes through sequential thiol–epoxy ‘click’ and esterification reactions†

Ikhlas Gadwal,<sup>a</sup> Taejun Eom,<sup>a</sup> JiHyeon Hwang,<sup>a</sup> Youngson Choe,<sup>b</sup> Joona Bang<sup>a</sup> and Anzar Khan<sup>✉\*</sup>

A synthetic strategy is devised for the preparation of mid-chain multifunctional polymers. In this strategy, small molecules carrying one or two epoxide units along with two polymerization-initiating sites were prepared in two to three synthetic steps. Atom transfer radical polymerization (ATRP) of methylmethacrylate (MMA) monomer using the newly designed initiators gave rise to epoxide-mid-reactive polymers. A careful chain cleavage study confirmed the midpoint location of the reactive site(s) on the polymer chain. Dual-modification of these reactive epoxide unit(s) through sequential thiol–epoxy and esterification reactions then afforded the midpoint multiply functionalized polymeric structures. Due to compatibility of the ATRP process with the reactive epoxide unit(s) and the cascade nature of the functionalization processes, the present strategy is free from the protective-group requirement of organic synthesis. Moreover, it allows for varying the number and nature of functionalities at the midpoint of a polymer chain.

## Introduction

Post-polymerization modification of polymers is a valuable tool in generating functional soft materials.<sup>1–8</sup> In this regard, side-chain<sup>1–5</sup> and end-chain<sup>6–8</sup> polymer functionalization has received enormous attention. General methods for addressing the polymer mid-chain for functionalization processes, however, are relatively few.<sup>9–12</sup> Strategies seeking further increase in the molecular complexity at the midpoint of a polymer chain by carrying out more than one protective-group-free functionalization step remains, to the best of our knowledge, unknown. Towards this end, we demonstrate a modular strategy for multiple functionalization of the polymer mid-chain through sequential application<sup>13</sup> of thiol–epoxy ‘click’<sup>14</sup> and esterification reactions. The devised approach is free from protective-group requirements and allows for adjusting the number and nature of functional groups at the middle of a polymer chain (Scheme 1).

Our approach relies on the functional group tolerance of the ATRP process<sup>15–20</sup> that allows for the preparation of polymers substituted with reactive epoxide groups<sup>21</sup> at the centre of a polymer chain. These epoxide units can undergo a ring opening reaction with a thiol molecule to form a thio-ether

Scheme 1 Application of orthogonal and sequential processes to address polymer mid-chain for multiple functionalizations.

linkage.<sup>14,20,22–24</sup> This base-catalyzed chemistry is established to be an efficient process that is capable of transforming thousands of epoxide repeat units into functionalized thio-ether linkages. The process is practically simple and proceeds under ambient conditions. An added advantage of this chemistry is that a reactive hydroxyl group is produced upon completion of the coupling reaction. This secondary hydroxyl group, although less reactive than the primary hydroxyl group, can be converted into an ester moiety upon reaction with an acid chloride molecule.<sup>25</sup> This sequential functionalization processes gives rise to doubly functionalized structures in a protective-group-free fashion. Commercial availability of a variety of functional thiol and acid chloride molecules further enhances the scope of the present strategy in the preparation of functional materials.

## Experimental details

### Synthesis of 1a

To a stirring solution of bromoisobutyl bromide (10.44 g, 45.41 mmol) in THF (40 mL) was added triethylamine (TEA) (8.66 g, 85.64 mmol) drop wise at 5 °C and stirring was continued for another 20 min. To this reaction mixture was added 3,5-dihydroxybenzoic acid (2.0 g, 12.97 mmol) in THF (25 mL) drop wise through a syringe pump (0.86 mL min<sup>-1</sup>) at -5 °C. The reaction mixture was stirred for 2 hours at -5 °C and then warmed up to 0 °C. After this, the triethylamine salts formed during the reaction were removed by filtration. The filtrate was concentrated under reduced pressure and the crude material obtained was dissolved in DCM (50 mL) and washed with water (2 × 50 mL) and brine (20 mL). The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure. The crude product was then purified by silica gel column chromatography using a DCM : MeOH solvent gradient (98 : 2 to 96 : 4). The resulting brown solid was further purified by crystallization from a DCM : hexane mixture to afford 2.12 g of the product as a white solid (yield = 36%). <sup>1</sup>H-NMR (δ, ppm, 300 MHz, DMSO-*d*<sub>6</sub>): 13.59 (br s, 1H), 7.67 (d, *J* = 2.24 Hz, 2H), 7.41 (t, *J* = 2.24 Hz, 1H), 2.05 (s, 12H); <sup>13</sup>C-NMR (δ, ppm, 75 MHz, DMSO-*d*<sub>6</sub>): 169.29, 165.45, 150.81, 133.39, 120.10, 119.50, 56.83, 29.89; ESI-MS *m/z* = 472.92 [M + Na]<sup>+</sup> (calcd 472.93 for C<sub>15</sub>-H<sub>16</sub>Br<sub>2</sub>O<sub>6</sub>Na); IR (cm<sup>-1</sup>): 2939, 1754, 1696, 1586, 1462, 1443, 1406, 1387, 1370, 1299, 1255, 1133, 1095, 1007, 986, 925, 770, 732, 654, 602, 572.

### Synthesis of 1

To a stirring solution of 1a (1.9 g, 4.2 mmol), glycidol (0.59 g, 7.98 mmol), and 4-(*N,N'*-dimethylamino)pyridinium-4-toluenesulfonate (DPTS) (0.23 g, 0.84 mmol) in DCM (30 mL), was added dicyclohexylcarbodiimide (DCC) (1.04 g, 5.04 mmol) in several portions at 0 °C. The resulting reaction mixture was then stirred at room temperature for 12 hours. After this time, the reaction mixture was cooled to 0 °C. This resulted in precipitation of dicyclohexylurea (DCU) that was removed through filtration. The filtrate was concentrated under reduced pressure and the crude thus obtained was purified by silica gel column chromatography using heptane : EtOAc solvent

gradient (95 : 5 to 85 : 15) to afford 0.94 g of the product as a white solid (yield = 44%). <sup>1</sup>H-NMR (δ, ppm, 300 MHz, CDCl<sub>3</sub>): 7.76 (d, *J* = 2.26 Hz, 2H), 7.24 (t, *J* = 2.26 Hz, 1H), 4.68 (dd, *J* = 3.04, 12.23 Hz, 1H), 4.16 (dd, *J* = 6.42, 12.23 Hz, 1H), 3.35 (m, 1H), 2.91 (t, *J* = 4.40 Hz, 1H), 2.72 (dd, *J* = 2.67, 4.92 Hz, 1H), 2.07 (s, 12H); <sup>13</sup>C-NMR (δ, ppm, 75 MHz, CDCl<sub>3</sub>): 169.81, 164.51, 151.25, 132.17, 120.57, 119.77, 66.46, 54.87, 49.42, 44.92, 30.69; ESI-MS *m/z* = 528.94 [M + Na]<sup>+</sup> (calcd 528.96 for C<sub>18</sub>H<sub>20</sub>Br<sub>2</sub>O<sub>7</sub>-Na); IR (cm<sup>-1</sup>): 2961, 1754, 1724, 1596, 1465, 1440, 1389, 1368, 1346, 1298, 1258, 1220, 1137, 1096, 997, 927, 906, 865, 790, 767, 745, 682, 652.

### Synthesis of 2a

To a stirring solution of 1a (2.0 g, 4.42 mmol), trimethylolpropane diallyl ether (1.09 g, 5.08 mmol), and dimethylaminopyridine (DMAP) (0.108 g, 0.884 mmol) in THF (20 mL) was added DCC (1.09 g, 5.30 mmol) in several portions at 0 °C. The resulting reaction mixture was then stirred at room temperature for 12 hours. After this time, the reaction mixture was cooled to 0 °C. This resulted in the precipitation of dicyclohexylurea (DCU) that was removed through filtration. The filtrate was concentrated under reduced pressure and the crude thus obtained was purified by silica gel column chromatography using heptane : EtOAc solvent gradient (98 : 2 to 95 : 5) to afford 1.6 g of the product as a colourless viscous liquid (yield = 56%). <sup>1</sup>H-NMR (δ, ppm, 300 MHz, CDCl<sub>3</sub>): 7.69 (d, *J* = 2.21 Hz, 2H), 7.21 (t, *J* = 2.21 Hz, 1H), 5.86 (m, 2H), 5.18 (m, 4H), 4.32 (s, 2H), 3.95 (d, *J* = 5.53 Hz, 4H), 3.40 (s, 4H), 2.07 (s, 12H), 1.53 (q, *J* = 7.47 Hz, 2H), 0.91 (t, *J* = 7.47 Hz, 3H); <sup>13</sup>C-NMR (δ, ppm, 75 MHz, CDCl<sub>3</sub>): 169.81, 164.62, 151.21, 135.06, 133.15, 120.24, 119.34, 116.79, 72.48, 70.49, 66.56, 54.97, 42.77, 30.67, 23.33, 7.80; ESI-MS *m/z* = 647.08 [M + H]<sup>+</sup> (calcd 647.08 for C<sub>27</sub>H<sub>37</sub>Br<sub>2</sub>O<sub>8</sub>); IR (cm<sup>-1</sup>): 2933, 1758, 1726, 1596, 1462, 1443, 1391, 1370, 1350, 1299, 1256, 1224, 1134, 1095, 990, 925, 764, 681, 654.

### Synthesis of 2

To a stirring solution of 2a (1.6 g, 2.46 mmol) in CHCl<sub>3</sub> (10 mL), was added a solution of 70% *m*-chloroperoxybenzoic acid (3.4 g, 19.74 mmol) in CHCl<sub>3</sub> (25 mL) at 0 °C in a drop wise fashion. The resulting reaction mixture was stirred at room temperature for 20 hours, and then washed with 0.3 M NaOH (2 × 25 mL) and water (25 mL), dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated under reduced pressure to give a colourless liquid. This crude product was purified by silica gel column chromatography using a DCM : EtOAc solvent gradient (99 : 1 to 95 : 5) to afford 0.79 g of the product as a colourless viscous liquid. (Yield = 47%). <sup>1</sup>H-NMR (δ, ppm, 300 MHz, CDCl<sub>3</sub>): 7.71 (d, *J* = 2.24 Hz, 2H), 7.21 (t, *J* = 2.24 Hz, 1H), 4.31 (s, 2H), 3.72 (m, 2H), 3.48 (m, 4H), 3.36 (m, 2H), 3.10 (m, 2H), 2.75 (t, *J* = 4.85 Hz, 2H), 2.56 (dd, *J* = 2.79, 4.97 Hz, 2H), 2.07 (s, 12H), 1.54 (q, *J* = 7.58 Hz, 2H), 0.91 (t, *J* = 7.58 Hz, 3H); <sup>13</sup>C-NMR (δ, ppm, 75 MHz, CDCl<sub>3</sub>): 169.68, 164.49, 151.11, 132.89, 120.15, 119.25, 72.11, 72.09, 71.51, 66.17, 54.87, 50.89, 44.02, 42.82, 30.52, 23.07, 7.62; ESI-MS *m/z* = 696.10 [M + NH<sub>4</sub>]<sup>+</sup> (calcd 696.07 for C<sub>27</sub>H<sub>40</sub>Br<sub>2</sub>NO<sub>8</sub>); IR (cm<sup>-1</sup>): 2924, 1756, 1722, 1595, 1461, 1442, 1388, 1371, 1300, 1258, 1225, 1133, 1097, 997, 902, 848, 764, 684, 654.

### Epoxy functionalized polymer 3

Atom transfer radical polymerization (ATRP) initiator **1** (0.03 g, 0.059 mmol), methyl methacrylate (5.08 g, 50.77 mmol), pentamethyldiethylenetriamine (PMDETA) (0.032 g, 0.188 mmol), and anisole (7.0 mL) were taken in a Schlenk tube and degassed by two freeze–pump–thaw cycles. Cu(I)Br (0.013 g, 0.94 mmol) was added to the frozen solution and degassed again by one freeze–pump–thaw cycle. The reaction mixture was then stirred under nitrogen atmosphere in a pre-heated oil bath at 35 °C for 90 minutes. After this time, the reaction vessel was opened to air, cooled to room temperature, and precipitated into 400 mL of methanol. The precipitated polymer was isolated by filtration and purified by passing through a small plug of silica gel using DCM (150 mL) as eluent. The collected fractions were concentrated and precipitated into 300 mL of methanol. The polymer precipitate was collected by filtration and dried to give 0.64 g of the product as a white powder (monomer conversion 13%). <sup>1</sup>H-NMR ( $\delta$ , ppm, 300 MHz, CDCl<sub>3</sub>): 7.61 (br s, 2H), 7.08 (br s, 1H), 4.67 (d,  $J = 12.21$  Hz, 1H), 4.16 (m, 1H), 3.84–3.35 (br s, backbone, –OCH<sub>3</sub>), 2.91 (t,  $J = 4.53$  Hz, 1H), 2.72 (m, 1H), 2.13–0.63 (br m, backbone); GPC:  $M_n = 15\ 000$ ,  $M_w = 19\ 500$ , PDI ( $M_w/M_n$ ) = 1.3; IR (cm<sup>-1</sup>): 2955, 1723, 1481, 1441, 1387, 1268, 1240, 1193, 1145, 987, 965, 840, 750.

### Epoxy functionalized polymer 4

Atom transfer radical polymerization (ATRP) initiator **2** (0.03 g, 0.044 mmol), methyl methacrylate (5.07 g, 50.70 mmol), PMDETA (0.032 g, 0.185 mmol), and anisole (7.0 mL) were taken in a Schlenk tube and degassed by two freeze–pump–thaw cycles. Cu(I)Br (0.013 g, 0.92 mmol) was added to the frozen solution and degassed again by one freeze–pump–thaw cycle. The reaction mixture was then stirred under nitrogen atmosphere in a pre-heated oil bath at 35 °C for 90 minutes. After this time, the reaction vessel was opened to air, cooled to room temperature, and precipitated into 400 mL of methanol. The precipitated polymer was isolated by filtration and purified by passing through a small plug of silica gel using DCM (150 mL) as eluent. The collected fractions were concentrated and precipitated into 300 mL of methanol. The polymer precipitate was collected by filtration and dried to give 0.77 g of the product as a white powder (monomer conversion 15%). <sup>1</sup>H-NMR ( $\delta$ , ppm, 300 MHz, CDCl<sub>3</sub>): 7.57 (br s, 2H), 7.03 (br s, 1H), 4.29 (s, 2H), 3.84–3.35 (br s, backbone, –OCH<sub>3</sub>), 3.10 (s, 2H), 2.76 (t,  $J = 4.83$  Hz, 2H), 2.57 (m, 2H), 2.07–0.63 (br m, backbone); GPC:  $M_n = 26\ 300$ ,  $M_w = 33\ 200$ , PDI ( $M_w/M_n$ ) = 1.2; IR (cm<sup>-1</sup>): 2961, 1723, 1447, 1270, 1239, 1189, 1142, 993, 966, 839, 746.

### Thiol functionalized polymer 5 (using LiOH as a base)

To a stirring solution of polymer **3** (0.13 g, 0.0081 mmol) and 1-thionaphthol (0.019 g, 0.12 mmol) in THF (1.5 mL), was added LiOH (0.204 mg, 0.0048 mmol) in 0.040 mL of water (a stock solution was prepared before) at 0 °C. The resulting reaction mixture was stirred for 18 hours at ambient temperature. THF was evaporated and the crude polymer was dissolved in DCM (20 mL) and washed with water (10 mL). The organic layer was

dried, concentrated, and the polymer obtained was dissolved in a minimum quantity of DCM and precipitated into MeOH (50 mL), then filtered and dried to give 0.12 g of the product (yield = 91%). <sup>1</sup>H-NMR ( $\delta$ , ppm, 300 MHz, CDCl<sub>3</sub>): 8.44 (d,  $J = 8.27$  Hz, 1H), 7.85 (d,  $J = 7.64$  Hz, 1H), 7.77 (d,  $J = 8.01$  Hz, 1H), 7.70 (d,  $J = 7.27$  Hz, 1H), 7.62–7.38 (br m, 5H), 7.08 (br s, 1H), 4.42 (m, 2H), 4.08 (br s, 1H), 3.84–3.34 (br s, backbone –OCH<sub>3</sub>), 3.20 (br s, 2H), 2.07–0.63 (br m, backbone); GPC:  $M_n = 15\ 800$ ,  $M_w = 20\ 400$ , PDI ( $M_w/M_n$ ) = 1.3; IR (cm<sup>-1</sup>): 2955, 1723, 1481, 1441, 1387, 1268, 1240, 1193, 1145, 987, 965, 840, 750.

### Thiol functionalized polymer 5 (using TEA as a base)

To a stirring solution of polymer **3** (0.030 g, 0.00187 mmol) and 1-thionaphthol (0.014 g, 0.09 mmol) in THF (0.3 mL), was added TEA (0.113 g, 0.112 mmol) at ambient temperature. The resulting reaction mixture was stirred for 16 hours. The solvent was reduced under low pressure and the crude polymer was dissolved in DCM (4 mL) and washed with water. The organic layer was dried, concentrated, and the polymer obtained was dissolved in a minimum quantity of DCM and precipitated into MeOH (30 mL), then filtered and dried to give 0.025 g of the product in 82% yield.

### Thiol functionalized polymer 6 (using LiOH as a base)

To a stirring solution of polymer **4** (0.1 g, 0.005 mmol) and 1-thionaphthol (0.024 g, 0.15 mmol) in THF (1.5 mL), was added LiOH (0.188 mg, 0.0045 mmol) in 0.037 mL of water (a stock solution was prepared before) at 0 °C. The resulting reaction mixture was stirred for 18 hours at ambient temperature. THF was evaporated and the crude polymer was dissolved in DCM (20 mL) and washed with water (10 mL). The organic layer was dried, concentrated, and the polymer obtained was dissolved in a minimum quantity of DCM and precipitated into MeOH (50 mL), then filtered and dried to give 0.092 g of the product (yield = 91%). <sup>1</sup>H-NMR ( $\delta$ , ppm, 300 MHz, CDCl<sub>3</sub>): 8.39 (d,  $J = 8.26$  Hz, 2H), 7.83 (d,  $J = 7.54$  Hz, 2H), 7.73 (d,  $J = 7.71$  Hz, 2H), 7.61 (d,  $J = 7.20$  Hz, 2H), 7.53 (m, 6H), 7.38 (t,  $J = 7.94$  Hz, 2H), 7.03 (br s, 1H), 4.23 (s, 2H), 3.84–3.35 (br s, backbone –OCH<sub>3</sub>), 3.09 (m, 4H), 2.07–0.63 (br m, backbone); GPC:  $M_n = 25\ 500$ ,  $M_w = 33\ 700$ , PDI ( $M_w/M_n$ ) = 1.3; IR (cm<sup>-1</sup>): 2961, 1723, 1447, 1270, 1239, 1189, 1142, 993, 966, 839, 746.

### Thiol functionalized polymer 6 (using TEA as a base)

To a stirring solution of polymer **4** (0.020 g, 0.001 mmol) and 1-thionaphthol (0.020 g, 0.128 mmol) in THF (0.4 mL), was added TEA (0.0161 g, 0.16 mmol) at ambient temperature. The resulting reaction mixture was stirred for 16 hours. The solvent was removed and the crude polymer was dissolved in DCM (4 mL) and washed with water. The organic layer was dried, concentrated, and the polymer obtained was dissolved in a minimum quantity of DCM and precipitated into MeOH (30 mL), then filtered and dried to give 0.016 g of the product in 78% yield.

### Bifunctional polymer 7

To a stirring solution of polymer 5 (0.060 g) in pyridine (1 mL), was added *p*-toluoyl chloride (0.1 mL) at 0 °C. The reaction mixture was stirred at 0 °C for 1 hour and then at room temperature for 18 hours. Pyridine was removed under reduced pressure and the crude polymer thus obtained was dissolved in DCM (10 mL) and washed with water (10 mL), saturated aqueous solution of NaHCO<sub>3</sub> (10 mL), and 0.5 M HCl solution (10 mL). The organic layer was dried, concentrated, and the polymer thus obtained was dissolved in a minimum amount of DCM and precipitated into MeOH (40 mL). The precipitate was collected by filtration, washed with MeOH, and dried to give 0.05 g of the product (yield = 82%). <sup>1</sup>H-NMR (δ, ppm, 300 MHz, CDCl<sub>3</sub>): 8.42 (d, *J* = 8.30 Hz, 1H), 7.77 (m, 5H), 7.55–7.38 (m, 5H), 7.18 (d, *J* = 8.03 Hz, 2H), 7.04 (br s, 1H), 5.52 (m, 1H), 4.65 (m, 2H), 3.84–3.34 (br m, backbone –OCH<sub>3</sub>), 2.40 (s, 3H), 2.07–0.63 (br m, backbone); GPC: *M*<sub>n</sub> = 14 900, *M*<sub>w</sub> = 19 500, PDI (*M*<sub>w</sub>/*M*<sub>n</sub>) = 1.3 IR (cm<sup>-1</sup>): 2955, 1723, 1481, 1441, 1387, 1268, 1240, 1193, 1145, 987, 965, 840, 750.

### Bifunctional polymer 8

To a stirring solution of polymer 6 (0.050 g) in pyridine (1 mL), was added *p*-toluoyl chloride (0.08 mL) at 0 °C. The reaction mixture was stirred at 0 °C for 1 hour and then at room temperature for 18 hours. Pyridine was removed under reduced pressure and the crude polymer thus obtained was dissolved in DCM (10 mL) and washed with water (10 mL), saturated solution of NaHCO<sub>3</sub> (10 mL), and 0.5 M HCl solution (10 mL). The organic layer was dried, concentrated, and the polymer thus obtained was dissolved in a minimum amount of DCM and precipitated into MeOH (40 mL). The precipitate was collected by filtration, washed with MeOH, and dried to give 0.042 g of the product (yield = 83%). <sup>1</sup>H-NMR (δ, ppm, 300 MHz, CDCl<sub>3</sub>): 8.36 (d, *J* = 8.14 Hz, 2H), 7.72 (m, 10H), 7.50 (m, 6H), 7.35 (t, *J* = 7.72 Hz, 2H), 7.12 (d, *J* = 7.76 Hz, 4H), 7.02 (br s, 1H), 5.28 (m, 2H), 4.16 (s, 2H), 3.84–3.33 (br m, backbone –OCH<sub>3</sub>), 2.35 (s, 6H), 2.07–0.64 (br m, backbone); GPC: *M*<sub>n</sub> = 27 300, *M*<sub>w</sub> = 35 900, PDI (*M*<sub>w</sub>/*M*<sub>n</sub>) = 1.3; IR (cm<sup>-1</sup>): 2961, 1723, 1447, 1270, 1239, 1189, 1142, 993, 966, 839, 746.

### Hydrolysis of 3

To a solution of polymer 3 (50 mg, 0.0031 mmol) in THF (2 mL) and MeOH (2 mL), NaOH (51 mg, 1.281 mmol) was added and the reaction mixture was refluxed at 65 °C for 20 hr. The solvent was then removed under reduced pressure and the crude thus obtained was suspended in water and then filtered. The solid was then washed with MeOH. Same procedure was employed for the hydrolysis of polymer 4.

## Results and discussion

To investigate the feasibility of the aforementioned concept, ATRP-based polymerization initiators carrying one (**1**) and two (**2**) epoxide groups along with two initiating sites were designed (Scheme 2). It was envisaged that polymerization from such dual initiating species would give rise to polymer chains having

Scheme 2 Synthesis of polymerization initiators.

reactive epoxide unit(s) at the midpoint of a polymer chain. To achieve synthesis of these initiators, 3,5-dihydroxybenzoic acid was subjected to an esterification reaction with bromoisobutyryl bromide (Scheme 2). The resulting benzoic acid derivative **1a** was further subjected to an esterification reaction with glycidol molecule to give initiator **1**. To obtain initiator **2**, **1a** was converted into the olefin derivative **2a** through an esterification reaction and then epoxidized using *m*-perchlorobenzoic acid in chloroform to furnish initiator **2**. <sup>1</sup>H-NMR spectroscopy confirmed the structure of these initiators as epoxy proton resonances could be observed in the range of 2.5–3.5 ppm and the aromatic proton resonances could be located in the range of 7–8 ppm (Fig. 1). This aromatic unit is referred to as the core unit in the forthcoming discussion. Initially, initiators **1** and **2** were subjected to a reaction with 1-naphthalenethiol using LiOH or triethylamine as a base. From this study, it became clear that thiol–halide reaction also occurred along with the thiol–epoxy reaction at the initiator level as two sets of aromatic resonances could be assigned to two different types of naphthalene substitutions (Fig. 2 and S4†).

Initiators **1** and **2** were then used for polymerization of methyl methacrylate monomer to give epoxide mid-functional poly(methyl methacrylate) (PMMA) polymers **3** (*M*<sub>n</sub> = 15 kDa, *M*<sub>w</sub>/*M*<sub>n</sub> = 1.3) and **4** (*M*<sub>n</sub> = 26 kDa, *M*<sub>w</sub>/*M*<sub>n</sub> = 1.2), respectively (Scheme 3). To confirm that the reactive centre was located at the centre of the polymer chain, the ester bonds that connect the polymer chain to the aromatic-core, in polymer **4**, were hydrolysed under basic conditions (Scheme 4). This resulted in cleavage of the polymer chain into two fragments of nearly equal molecular weight (*M*<sub>n</sub> = 13 kDa, *M*<sub>w</sub>/*M*<sub>n</sub> = 1.2) (Fig. 3 and

Fig. 1  $^1\text{H-NMR}$  of the ATRP initiators 1 (A) and 2 (B) in  $\text{CDCl}_3$ . Solvent signals are shown with an asterisk. Tetramethylsilane was used as an internal standard.

Fig. 2  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ ) of the product formed upon reaction of initiator 1 with 1-naphthalenethiol in the presence of LiOH as a base. Solvent signals are shown with an asterisk.

$\text{S5}^\dagger$ ). A similar result was obtained in the case of polymer 3. These experiments suggested that the reactive sites were located on the centre of the polymer chain.

To further investigate the cleavage chemistry, the polymer sample resulting from the hydrolysis reaction was purified and analysed by  $^1\text{H-NMR}$  spectroscopy (Fig. 4 and  $\text{S6}^\dagger$ ). In this analysis, it became clear that the ester bonds that connect the polymer chains to the aromatic core were hydrolysed as the resonances from the aromatic core (7–8 ppm) disappeared along with the methylene (4.2 ppm) and epoxide proton (2.5–3.5 ppm) signals in the  $^1\text{H-NMR}$  spectrum of the hydrolysed sample. The signals from the PMMA backbone (0.6–2.2 ppm), however, remained unchanged. More importantly, the integration of the methoxy-side chains of the polymer (3.3–3.9 ppm) matched with the integration of the polymer backbone suggesting that the side chain ester groups remained intact. This is in accordance with the previous polymer chain cleavage studies carried out under similar conditions on PMMA-based star polymers.<sup>26</sup>

Having established the central location of the reactive site(s), the first modification of the epoxide unit(s) in polymers 3 and 4 was achieved using 1-naphthalenethiol (functionalization I in Scheme 3). This reaction was carried out in the presence of LiOH at room temperature. To ensure complete conversion of the sterically hindered epoxy units, an excess of the thiol reagent was utilized (epoxy : thiol/1 : 15). This resulted in the

Scheme 3 Synthesis of polymers 7 and 8.

formation of the thio-ether bond and generation of the hydroxyl unit. Use of triethylamine as a base (instead of LiOH) also produced the same results. However, in case of LiOH, a catalytic amount was sufficient for thio-ether formation, whereas high excess of triethylamine is required for complete transformation of the epoxide group into the corresponding functionalized structure. Interestingly, only one set of aromatic proton resonances could be observed. Indicating that the halide-chain-end of the polymers did not participate in the substitution reaction as observed in the case of initiators. Modification of the

Scheme 4 Cleavage of the polymer chain to ascertain location of the reactive sites.

Fig. 3 GPC traces of the polymer 4 before (solid line) and after hydrolysis (dash line) in DMF.

Fig. 4  $^1\text{H-NMR}$  of the polymer 4 before (B) and after hydrolysis (A) in  $\text{CDCl}_3$ . Solvent signals are shown with an asterisk. Tetramethylsilane was used as an internal standard.

hydroxyl unit in polymers 5–6 with toluoyl chloride led to the formation of the targeted midpoint multifunctionalized structures 7 and 8 (functionalization II in Scheme 3). Once again, high excess of the acid chloride reagent was utilized due to the steric demand and relatively low reactivity of the secondary hydroxyl units (hydroxyl group : acid chloride/1 : 240).

The  $^1\text{H-NMR}$  spectrum of polymer 4 (A), and functionalized polymers 6 (B), and 8 (C) are shown in Fig. 5. Polymer 4 exhibited the characteristic proton resonances of the PMMA backbone in the range of 0.6–2.2 and 3.3–3.9 ppm. The epoxy proton signals could be detected at 2.57, 2.76, and 3.1 ppm. The first functionalization resulted in the disappearance of the epoxy proton resonances and emergence of the aromatic proton signals from the naphthalene group (7.3–8.4 ppm). Based on the small molecule study, this set of aromatic proton resonances could be assigned to the thioether formed upon the thiol–epoxy reaction. Absence of the other set of the aromatic resonances suggested that the thiol–bromo reaction did not occur in the present set of materials. This may be due to the steric hindrance created by the methyl group of poly(methyl methacrylate). Besides absence of

Fig. 5  $^1\text{H-NMR}$  of polymer 4 (A), and end-functionalized polymers 6 (B) and 8 (C) in  $\text{CDCl}_3$ . Solvent signals are shown with an asterisk. Tetramethylsilane was used as an internal standard.

a second set of aromatic signals, as seen at the initiator level, area integration analysis also suggested that the thiol–halide reaction did not occur (see Fig. S7† for area integration). UV-Vis spectroscopy also suggested a successful functionalization step as the absorption band centred on 300 nm could be assigned to the naphthalene chromophore (Fig. 6 and S8†). For the second functionalization, toluoyl chloride was chosen as a reactant. This choice was made because the signal from the methyl group of the toluoyl unit emerges in a region of the  $^1\text{H-NMR}$  spectrum that is free from proton resonance signals of the polymer backbone and mid-chain groups. Moreover, this signal is high in intensity and resolution when compared to the other signals. This allowed us to determine the extent of hydroxyl group conversion with the help of  $^1\text{H-NMR}$  spectroscopy. The esterification of polymer 6 gave rise to polymer 8 and area integration analysis between the proton resonances of the toluoyl unit (designated ‘e’ and ‘f’ in

Fig. 6 UV-Vis absorption spectra of polymers 4 (dot line), 6 (solid line), and 8 (dash line) in chloroform.

Fig. 5) and the naphthalene group suggested complete conversion of the hydroxyl units into the desired toluoyl esters (see Fig. S9† for area integrations). The proton resonance signal at 5.28 ppm could be ascribed to a proton located at the carbon adjacent to the newly formed ester group. In UV-Vis spectroscopy, the absorption band at 245 nm further increased in intensity after the esterification reaction (Fig. 6), most likely due to the incorporation of the toluoyl units in the molecular structure, once again suggesting successful functionalization of the polymer mid-chain through a sequential thiol-epoxy and esterification reaction.

To examine the effect of the functionalization reactions upon the hydrodynamic volume of the polymers, gel permeation chromatography (GPC) studies were undertaken. These studies established that the hydrodynamic volume of the precursor polymers and the functionalized structures remained the same as no changes in the retention time of the precursors and their functionalized analogues could be detected in the GPC chromatograms (Fig. S10 and S11†).

## Conclusions

To summarize, a general synthetic strategy for midpoint multifunctionalization of a polymer chain is established. For this, ATRP polymerization initiators appended with one and two epoxide unit(s) along with two polymerization initiation sites were prepared. Polymerization of methyl methacrylate monomer by using these initiators gave access to polymers with epoxide unit(s) at the centre of the polymer chain. The hydrolysis study confirmed the midpoint location of the reactive site(s) on the polymer chain. The first mid-chain functionalization was achieved through the thiol-epoxy reaction that instated optically active naphthalene functionality and gave rise to a reactive hydroxyl group at the centre of the polymer chain. Further functionalization of the hydroxyl unit with toluoyl chloride then led to the formation of the targeted midpoint multifunctional materials. The number of the mid-chain functionalities could be adjusted by adjusting the number of epoxide unit(s) on the polymerization initiator. The functional group compatibility of the ATRP process and the cascade nature of the functionalization processes delivered the established strategy free from the protection/deprotection requirement of organic synthesis and allowed for facile preparation of complex yet well-defined multifunctional polymeric structures.
