## Correction: Dye-sensitized electron transfer from TiO<sub>2</sub> to oxidized triphenylamines that follows first-order kinetics

Brian N. DiMarco, Ludovic Troian-Gautier, Renato N. Sampaio and Gerald J. Meyer\*

DOI: 10.1039/c7sc90080e www.rsc.org/chemicalscience

Correction for 'Dye-sensitized electron transfer from TiO<sub>2</sub> to oxidized triphenylamines that follows firstorder kinetics' by Brian N. DiMarco *et al.*, *Chem. Sci.*, 2018, DOI: 10.1039/c7sc03839a.

The authors regret that Scheme 1 is incorrect in the original manuscript as an arrow was not properly displayed. The correct scheme is shown below.

Scheme 1 Mechanism for the photoinitiation of the desired reaction. Visible light absorption by the ruthenium sensitizer induced rapid excitedstate electron injection to the acceptor state of  $TiO_2$ ,  $k_{inj} > 10^8 \text{ s}^{-1}$ . The oxidized sensitizer is then regenerated by triphenylamine (TPA) with a rate constant  $k_{reg}$ . This sequence provides the reactants for the desired charge recombination reaction of the injected electron with the oxidized triphenylamine redox mediator ( $k_{rec}$ ) that was quantified over a 0.5 eV change in driving force.

The Royal Society of Chemistry apologises for these errors and any consequent inconvenience to authors and readers.
