Copper-catalyzed intramolecular cross dehydrogenative coupling approach to coumestans from 2'-hydroxyl-3-arylcoumarins†

Xianheng Song,^a Xiang Luo,^a Jianfei Sheng,^a Jianheng Li,^a Zefeng Zhu,^a Zhibo Du,^b Hui Miao,^a Meng Yan,^a Mingkang Li^a and Yong Zou^a *ab

A copper-catalyzed intramolecular cross dehydrogenative C–O coupling reaction of 2'-hydroxyl-3-arylcoumarins was developed. This protocol provided a facile and efficient strategy for the construction of natural coumestans and derivatives in moderate to high yields. This transformation exhibited good functional group compatibility and was amenable to substrates with free phenolic hydroxyl groups.

Introduction

Coumestans are an important class of naturally occurring tetracyclic lactones with diverse biological properties and represent a valuable class of lead compounds for drug discovery.¹ For example, wedelolactone, coumestrol, aureol, medicagol and flemichapparin C are all naturally occurring coumestans exhibiting a broad spectrum of activities including anticancer, antibacterial, antifungal, antiosteoporosis, antihepatotoxic, antioxidative, estrogenic and neuroprotective effects.² Accordingly, coumestan derivatives have received significant attention and many synthetic approaches have been reported in the past decades.^{3–6} In 2016, McGlacken and Xu independently described a Pd(OAc)₂/Ag₂O and Pd(OAc)₂/AgOAc co-catalyzed intramolecular cross dehydrogenative C–C coupling reaction of 4-phenoxy-2-coumarins to provide coumestans and derivatives (Scheme 1).^{3a,j} These double C–H activation methods represented a rapid and efficient access to coumestans. Gogoi disclosed a palladium-catalyzed cascade [3 + 2] reaction of 4-hydroxycoumarins and *in situ* generated arynes^{3b} to give coumestans; this protocol is attractive in terms of atom economy. Tromp and McGlacken independently developed a palladium-catalyzed intramolecular C–H bond functionalization method by using preformed *ortho*-halogenated coumaryl ethers as starting materials.^{3c,3i} Zhao reported a FeCl₃-mediated direct intramolecular oxidative annellation protocol using 4-hydroxy-3-arylcoumarins,^{3d} which is probably the most straightforward strategy for constructing coumestans. Pappo and Tang

respectively offered a BBr₃-mediated tandem demethylation/lactonization reaction of 3-carboxylated benzofurans^{3e} or 2,3-bis(2-methoxyphenyl)-3-oxopropanals to form the coumestan nucleus (pyridinium dichromate was further needed to afford final coumestans in Tang's work).^{3g} Larock developed a palladium-catalyzed CO insertion (carbonylation) of 3-iodobenzofurans, followed by lactonization to afford coumestans.^{3h} Most recently, based on Nogami and his own early work, Tilve reported an oxidative cyclization method of 3-(2-hydroxyphenyl) coumarins promoted by stoichiometric amount of Cu(OAc)₂ in diphenyl ether at 258 °C.^{3k,3l,3m} Although great progress has been made, the above-mentioned methods still suffer from disadvantages such as the necessity of expensive palladium catalysts, pre-halogenated or specified substrates, the use of excess amount of the corrosive BBr₃ and environmentally hazardous chromium-containing oxidant, as well as the need of extremely high reaction temperature. Therefore, the development of a general strategy that is facile, efficient, noble metal-free and

compatible with polyphenolic substrates for the synthesis of coumestans would still be desired.

Cross coupling reactions for C–O bond formation are among the most important organic transformations because they provide key steps in building new and complex compounds either in inter- or intramolecular manner.⁷ In recent years, transition-metal catalyzed C–H bond activation and subsequent C–O bond formation represent a powerful tool for the modular and facile synthesis of oxygen-containing aromatic heterocycles,⁸ such as benzoxazoles,^{8a} dibenzofurans,^{8b} benzoxazines,^{8c} oxazinones^{8d} and oxadiazoles.^{8e} We envisaged that the coumestan motif could be effectively constructed through intramolecular cross dehydrogenative C–O coupling reaction of 2'-hydroxyl-3-aryl coumarins (2), which could be readily obtained through Perkin condensation between *ortho*-hydroxybenzaldehydes (3) and 2-hydroxyphenylacetic acids (4) (Scheme 2). As part of our continuing efforts on the green synthesis of natural products with C6–C2–C6 and C6–C3–C6

frameworks,⁹ we herein report a facile, efficient, noble metal-free and polyphenolic group tolerated strategy for the synthesis of coumestans.

Results and discussion

Initially, 2',4'-dihydroxyl-3-aryl coumarin (2a) was synthesized through Perkin condensation and used as the model substrate for the study of reaction conditions (Table 1). To our delight, the C–O dehydrogenative coupling reaction of 2a took place in DMSO at 135 °C catalyzed by 0.2 equiv. of Cu(OAc)₂/1,10-phen, affording the desired product 1a in 56% yield (Table 1, entry 1). Then, a series of commonly used solvents were examined. Results showed that DMF and glycol were unworkable with no 1a detected (entries 2 and 3). However, when *p*-xylene was used, 1a was obtained in 69% yield (entry 4). Interestingly, when the reaction was performed in DMSO/H₂O (3 : 1, v/v), a 78% yield was obtained (entry 5). Further screening of the solvent ratio revealed that DMSO/H₂O (3 : 1, v/v) gave the best result, whereas the 1 : 1, 2 : 1 or 4 : 1 (v/v) solvent ratio was less effective (compare entries 5–8). Subsequently, different oxidants were investigated, reaction performed under air gave similar result as under oxygen atmosphere (compare entries 5 and 9), other oxidants such as DTBP, TBHP, AgOAc, Ag₂CO₃ and Cu(OAc)₂ in 2–3 equivalent amount respectively, could also promote the reaction, but lower yields were obtained (entries 10–14). The choice of 1,10-phen as ligand was crucial for this reaction, other

^a Reaction conditions: 2a (1 mmol), catalyst (0.2 mmol), ligand (0.2 mmol) and an oxidant in a specific solvent (4 mL) at 135 °C for 18 h. ^b Isolated yield. ^c No desired product. ^d The reaction was performed under argon. ^e DTBP (3.0 equiv.) was added. ^f TBHP (3.0 equiv.) was used. ^g AgOAc (2.0 equiv.) was used. ^h Ag₂CO₃ (2.0 equiv.) was used. ⁱ Cu(OAc)₂ (2.0 equiv.) was used.

ligands, such as bipyridine, triethylamine and proline were unworkable in this transformation (entries 15–17). In addition, a screening of catalysts revealed that $\text{Cu}(\text{OAc})_2$ gave the best results in this reaction, while CuI or $\text{Cu}(\text{OTf})_2$ was also applicable (entries 18, 20). However, Cu_2O and $\text{Cu}(\text{TFA})_2$ were found to be inferior, giving only trace amount of desired product **1a** (entries 19, 21). Therefore, the optimal conditions for the synthesis of coumestans *via* intramolecular cross dehydrogenative C–O coupling reaction were as follows: **2a** (1.0 equiv.) and $\text{Cu}(\text{OAc})_2/1,10\text{-phen}$ (0.2 equiv.) in $\text{DMSO}/\text{H}_2\text{O}$ (3 : 1, v/v) were stirred at 135 °C under air.

With the optimized reaction conditions in hand, we then probed the generality of this methodology for the synthesis of diverse coumestans (Table 2). Satisfyingly, this intra-molecular oxidative C–O forming reaction displayed good functional group tolerance. Substrates bearing different groups on the D ring, such as –OH, –OMe, 3,4-dimethoxyl, 3,4,5-trimethoxyl, 3,4-methylenedioxy were examined and all of them reacted smoothly to give the desired products in moderate to high yields (Table 2, **1a–f**). Substrate with a naphthyl group (**2g**) also successfully led to the desired product **1g** in 70% yield. Moreover, substrates with –OH, –Me, –OMe, dimethoxyl, –Cl on the A ring also performed well, furnishing the desired coumestans **1h–r** in 37–87% yields. It is worth noting that this transformation exhibited good polyhydroxyl group tolerance, substrates bearing two phenolic hydroxy groups either on ring A

or ring D smoothly provided **1a**, **1g**, **1h**, **1i**, **1j**, **1n** in acceptable yields (53–81%). Furthermore, the structural correctness of these products was unambiguously confirmed by the X-ray single crystal analysis of **1e** (Fig. 1).¹⁰

To explore the synthetic utility of this copper-catalyzed intramolecular C–O forming protocol, the synthesis of natural coumestans, coumestrol (**1s**) and 9-methoxy-coumestrol (**1t**) has been carried out. As shown in Scheme 3, *m*-bromophenol (**8**) reacted with glyoxylic acid in aqueous NaOH successfully gave 2-bromo-4-hydroxymandelic acid (**7**) in 92% yield. Reduction of **7** using SnCl_2/HCl afforded 2-bromo-4-hydroxyphenylacetic acid (**5s**) in 80% yield. Then 2,4- dihydroxyphenylacetic acid (**4s**) could be readily obtained through hydroxylation in the presence of oxine-copper/NaOH, whereas 2-hydroxy-4-methoxyphenylacetic acid (**4t**) was obtained *via* Me_2SO_4 methylation followed by oxine-copper/NaOH hydroxylation. Subsequently, Perkin condensation of **4s+3b** and **4t+3b** gave 2',7-diacetylated 3-aryl coumarin intermediates **9s** and **9t**. Deacetylation of **9s** and **9t** in 10% aqueous NaOH followed by acidification with diluted HCl respectively provided the 2'-hydroxyl-3-aryl coumarin intermediates (**2s**, **2t**) in 91% and 89% yields. Finally, coumestrol (**1s**) and 9-methoxy-coumestrol (**1t**) were achieved under our optimized reaction conditions in 48% and 63% yields, respectively. Inspired by the above results, we then turned our attention towards the synthesis of three other natural coumestans, namely 8,9-dimethoxy-coumestrol (**1u**), medicagol (**1v**), and flemichapparin C (**1w**). As illustrated in Scheme 4A and 4B, starting from phenylacetic acids (**6u** and **6v**),

^a The reactions were carried out as follows: 3-aryl coumarins (**2**, 1.0 mmol), $\text{Cu}(\text{OAc})_2$ (20 mol%) and 1,10-phen (20 mol%) in $\text{DMSO}/\text{H}_2\text{O}$ (v/v = 3 : 1) at 135 °C for 18 h under air atmosphere. ^b Isolated yields.

Scheme 4 Synthesis of 8,9-dimethoxy-coumestrol (**1u**), medicagol (**1v**) and flemichapparin C (**1w**).

the *ortho*-hydroxylated phenylacetic acid intermediates (**4u** and **4v**) could be obtained through bromination and hydroxylation. Perkin condensation of **4u**+**3b**, **4v**+**3b**, and **4v**+**3c** successfully provided acetylated 3-aryl coumarin intermediates (**10**, **11v**, and **11w**) which could then be deacetylated in 10% aqueous NaOH, and acidified with diluted HCl to afford the corresponding 2'-hydroxyl-3-aryl coumarin intermediates (**2u**, **2v**, and **2w**) in 71%, 78%, and 70% yields. Finally, the 8,9-dimethoxy-coumestrol (**1u**), medicagol (**1v**) and flemichapparin C (**1w**) were assembled under optimized conditions in 61%, 36%, and 49% yields, respectively.

To gain more insight into the effect of water in the solvent of this protocol, control experiments were carried out by using **2j** as substrate (Scheme 5). As expected, the reaction performed smoothly under the standard conditions, affording the desired

Scheme 5 Control experiments.

Scheme 6 Possible mechanistic pathway.

coumestan product **1j** in 53% yield (eqn (1)). However, when anhydrous DMSO was used as the solvent, an interesting methylthiomethyl ether product (**1jj**) was obtained in 47% yield (eqn (2)). Interestingly, **1jj** could not proceed to afford the desired product **1j** under the standard conditions (eqn (3)). These results suggested that **1jj** might not be the intermediate of the reaction and the effect of water in the reaction is probably coming from the inhibition of the methylthiomethyl functionalization of hydroxyl group.¹¹

To further explore the reaction mechanism, the electron paramagnetic resonance (EPR) experiment was carried out by using **2a** as the substrate. Results showed that no obvious EPR signals were observed in the reaction mixture (see Scheme S1†). Moreover, it was also found that the addition of the typical radical scavengers including TEMPO and BHT (3.0 equiv.) did not significantly reduce the yields of this reaction, the desired product (**1a**) was obtained in 68% and 59% yields, respectively (see Scheme S2†). Therefore, a radical process may not be involved in the reaction pathway.

Based on the above results and previous literatures,^{9a,12} two plausible mechanisms for the intramolecular cross dehydrogenative C–O coupling are proposed (Scheme 6). In path I, the copper complex **A** was generated from **2** and Cu(II) catalyst. Then, with a ligand assisted concerted metalation-deprotonation (CMD), complex **B** was formed. The decomplexation of complex **B** delivered a six-membered Cu(II) species **C**, followed by reductive elimination to afford the cyclized product **1** with concomitant formation of Cu(0), which is reoxidized to Cu(II) under air to complete the catalytic cycle. In path II, π-complex **D** was formed *via* intermediate **A**, nucleophilic attack of the phenolic OH results in production of the cyclized intermediate **E**, which then undergoes β-hydride elimination to generate the product **1** and Cu(0).

Conclusions

We have developed a practical and efficient copper-catalyzed intramolecular cross dehydrogenative C–O coupling reaction for the synthesis of coumestans from readily available 2'-hydroxyl-3-aryl coumarins. This protocol delivers natural coumestans and derivatives in moderate to excellent yields. Mild

and noble metal-free conditions, high efficiency, and good tolerability for phenolic hydroxyl groups make this approach a useful strategy for the construction of coumestan analogues.

Experimental section

General information

All reagents used in the synthesis were obtained commercially and used without further purification unless otherwise specified. The reactions were monitored by thin-layer chromatography (TLC) on glass-packed precoated silica gel plates and visualized in an iodine chamber or with a UV lamp (254 nm). The ^1H NMR and ^{13}C NMR spectra were recorded using TMS as the internal standard on a Bruker BioSpin GmbH spectrometer at 400, 500, and 100, 125 MHz, respectively, and the coupling constants are reported in hertz. The high-resolution mass spectra (HRMS) were obtained using a Shimadzu LCMS-ITTOF mass spectrometer. Flash column chromatography was performed using silica gel (200–300 mesh) purchased from Qingdao Haiyang Chemical Co. Ltd. EPR spectra were recorded on a Bruker A300 spectrometer. X-ray diffraction data were collected at 100 K on an in-house Oxford Diffraction Xcalibur Nova diffractometer (Cu-K α radiation). The data were processed using the program CrysAlis Pro.

General procedure for the synthesis coumestans (1)

An oven-dried vial was charged with corresponding substrate (2, 1 mmol), Cu(OAc) $_2$ (0.2 mmol, 20 mol%), 1,10-phen (0.2 mmol, 20 mol%), DMSO (3 mL) and H $_2$ O (1 mL). The vial was sealed under air and heated to 135 $^\circ\text{C}$ with stirring for 18 hours. After cooling down, the mixture was diluted with H $_2$ O (20 mL) and extracted with EtOAc (20 mL \times 3). The organic layer was dried, filtered and concentrated to give the crude product which was directly applied to a flash column chromatography using EtOAc/petroleum ether as the eluent to give the corresponding coumestans (1).

9-Hydroxy-6H-benzofuro[3,2-c]chromen-6-one (1a).^{1b} 196.7 mg, 78.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.17 (s, 1H), 8.03 (dd, J = 7.8, 1.3 Hz, 1H), 7.77 (d, J = 8.4 Hz, 1H), 7.69 (ddd, J = 8.7, 7.3, 1.6 Hz, 1H), 7.59 (dd, J = 8.4, 0.6 Hz, 1H), 7.53–7.45 (m, 1H), 7.22 (d, J = 1.9 Hz, 1H), 7.00 (dd, J = 8.5, 2.1 Hz, 1H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 158.3, 157.7, 157.2, 156.4, 152.5, 131.6, 124.9, 121.3, 121.1, 117.0, 114.4, 112.2, 105.4, 98.7. 8,9,10-Trimethoxy-6H-benzofuro[3,2-c]chromen-6-one (1e). 215.3 mg, 66.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 8.10 (dd, J = 7.7, 1.4 Hz, 1H), 7.76–7.68 (m, 1H), 7.59 (d, J = 8.4 Hz, 1H), 7.50 (t, J = 7.6 Hz, 1H), 7.13 (d, J = 6.5 Hz, 1H), 4.21 (s, 3H), 3.90 (s, 3H), 3.82 (s, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 159.8, 157.7, 153.2, 152.8, 141.8, 140.6, 139.5, 132.7, 125.5, 122.2, 119.4, 117.6, 112.5, 105.8, 96.7, 61.5, 56.7. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for C $_{18}\text{H}_{15}\text{O}_6$, 327.0863, found 327.0854.

8,9-Methylenedioxy-6H-benzofuro[3,2-c]chromen-6-one (1f). 109.3 mg, 39.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 8.01 (d, J = 7.5 Hz, 1H), 7.70 (t, J = 7.7 Hz, 1H), 7.60 (d, J = 10.7 Hz, 2H), 7.50 (t, J = 7.5 Hz, 1H), 7.33 (s, 1H), 6.18 (s, 2H). ^{13}C NMR (100 MHz, CDCl $_3$) δ 159.2, 158.3, 152.9, 151.0, 147.9, 146.3, 131.2, 124.7, 121.3, 117.5, 116.9, 112.9, 106.5, 102.1, 100.3, 94.1. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for C $_{16}\text{H}_9\text{O}_5$, 281.0444, found 281.0444.

11-Hydroxy-8H-benzofuro[3,2-c]chromen-8-one (1g). 211.6 mg, 70.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.22 (s, 1H), 9.12 (d, J = 8.4 Hz, 1H), 8.22 (d, J = 9.0 Hz, 1H), 8.12 (d, J = 7.9 Hz, 1H), 7.85 (dd, J = 15.4, 8.0 Hz, 2H), 7.70 (dd, J = 15.3, 8.2 Hz, 2H), 7.35 (s, 1H), 7.04 (d, J = 8.3 Hz, 1H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 160.1, 158.2, 157.7, 156.9, 153.1, 133.1, 130.5, 129.5, 129.4, 127.1, 126.9, 125.5, 121.6, 117.7, 115.1, 114.3, 107.1, 106.2, 99.2. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for C $_{19}\text{H}_{11}\text{O}_4$, 303.0652, found 303.0645.

3-Hydroxy-6H-benzofuro[3,2-c]chromen-6-one (1h). 204.3 mg, 81.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.78 (s, 1H), 7.88–7.79 (m, 2H), 7.78–7.71 (m, 1H), 7.49–7.35 (m, 2H), 6.94–6.81 (m, 2H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 162.4, 161.1, 157.9, 155.7, 154.9, 126.7, 125.7, 123.7, 123.6, 120.8, 114.4, 112.4, 104.3, 103.5, 102.2, 40.6, 40.4, 40.2, 39.9, 39.7, 39.5, 39.3. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for C $_{15}\text{H}_9\text{O}_4$, 253.0495, found 253.0493.

3-Hydroxy-6H-benzofuro[3,2-c]chromen-6-one (1i). 163.7 mg, 58.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.86 (s, 1H), 7.92 (d, J = 8.6 Hz, 1H), 7.77 (d, J = 9.0 Hz, 1H), 7.37 (d, J = 2.6 Hz, 1H), 7.09 (dd, J = 9.0, 2.7 Hz, 1H), 7.04–6.91 (m, 2H), 3.90 (s, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 162.3, 161.6, 157.9, 157.6, 155.6, 149.6, 124.5, 123.7, 114.7, 114.3, 113.1, 104.4, 103.6, 103.3, 102.4, 56.2. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for C $_{16}\text{H}_{11}\text{O}_5$, 283.0601, found 283.0595.

3-Hydroxy-8,9,10-trimethoxy-6H-benzofuro[3,2-c]chromen-6-one (1j). 181.4 mg, 53% yield, white solid. ^1H NMR (400 MHz,

DMSO- d_6) δ 10.77 (s, 1H), 7.95 (d, J = 8.5 Hz, 1H), 7.13 (s, 1H), 6.95 (dd, J = 8.5, 2.2 Hz, 1H), 6.93 (d, J = 2.0 Hz, 1H), 4.19 (s, 3H), 3.90 (s, 3H), 3.81 (s, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 162.1, 160.9, 158.0, 155.4, 152.6, 141.2, 139.9, 139.5, 123.6, 119.7, 114.3, 104.4, 103.5, 102.5, 96.5, 61.5, 61.5, 56.7. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{18}\text{H}_{15}\text{O}_7$, 343.0812, found 343.0803.

2-Methyl-6H-benzofuro[3,2-c]chromen-6-one (1k).^{3b} 145.1 mg, 58.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 7.96 (d, J = 7.3 Hz, 1H), 7.90–7.79 (m, 2H), 7.59–7.44 (m, 4H), 2.43 (s, 3H). ^{13}C NMR (100 MHz, CDCl_3) δ 160.0, 158.2, 155.5, 151.9, 134.5, 133.0, 126.6, 125.1, 123.6, 121.8, 121.5, 117.2, 112.3, 111.7, 105.8, 20.9. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{16}\text{H}_{11}\text{O}_3$, 251.0703, found 251.0701.

3-Methoxy-6H-benzofuro[3,2-c]chromen-6-one (1l).¹⁴ 202.3 mg, 76.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 8.00 (d, J = 8.7 Hz, 1H), 7.97–7.91 (m, 1H), 7.87 (dd, J = 6.9, 1.7 Hz, 1H), 7.57–7.46 (m, 2H), 7.22 (d, J = 2.3 Hz, 1H), 7.11 (dd, J = 8.8, 2.4 Hz, 1H), 3.91 (s, 3H). ^{13}C NMR (100 MHz, CDCl_3) δ 168.2, 165.5, 162.6, 160.4, 159.9, 131.7, 130.6, 128.3, 125.7, 118.5, 117.3, 110.3, 107.7, 106.9, 61.3. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{16}\text{H}_{11}\text{O}_4$, 267.0652, found 267.0650.

2-Chloro-6H-benzofuro[3,2-c]chromen-6-one (1m).^{3m} 108.3 mg, 40.0% yield, white solid. ^1H NMR (400 MHz, CDCl_3) δ 8.20–8.11 (m, 1H), 8.02 (d, J = 2.3 Hz, 1H), 7.69 (d, J = 8.1 Hz, 1H), 7.58–7.43 (m, 4H). ^{13}C NMR (100 MHz, CDCl_3) δ 158.6, 157.4, 155.7, 151.9, 131.9, 130.3, 127.3, 125.5, 123.2, 122.0, 121.4, 118.9, 113.7, 111.9, 106.6. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{15}\text{H}_8\text{ClO}_3$, 271.0156, found 271.0156.

9-Hydroxy-3-methoxy-6H-benzofuro[3,2-c]chromen-6-one (1n).¹³ 223.0 mg, 79.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.07 (s, 1H), 7.95 (d, J = 8.7 Hz, 1H), 7.72 (d, J = 8.4 Hz, 1H), 7.32–7.14 (m, 2H), 7.10 (d, J = 8.7 Hz, 1H), 6.97 (d, J = 8.4 Hz, 1H), 3.90 (s, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 162.8, 159.6, 157.9, 157.7, 156.6, 155.0, 122.9, 121.2, 114.9, 114.6, 113.5, 105.9, 103.3, 102.1, 99.2, 56.5. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{16}\text{H}_{11}\text{O}_5$, 283.0601, found 283.0598.

3,8,9-Trimethoxy-6H-benzofuro[3,2-c]chromen-6-one (1o).^{3d} 225.1 mg, 69.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 7.93 (d, J = 8.4 Hz, 1H), 7.58 (s, 1H), 7.35 (s, 1H), 7.21 (s, 1H), 7.11 (d, J = 8.1 Hz, 1H), 3.89 (d, J = 10.3 Hz, 9H). ^{13}C NMR (100 MHz, CDCl_3) δ 162.5, 159.8, 158.8, 154.9, 150.0, 149.1, 148.0, 122.3, 115.6, 113.0, 106.3, 103.9, 102.3, 101.5, 95.6, 56.6, 56.4, 55.8. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{18}\text{H}_{15}\text{O}_6$, 327.0863, found 327.0861.

3,8,9,10-Tetramethoxy-6H-benzofuro[3,2-c]chromen-6-one (1p). 238.7 mg, 67.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 7.90 (d, J = 8.7 Hz, 1H), 7.09 (s, 1H), 7.02 (d, J = 10.0 Hz, 2H), 4.19 (s, 3H), 3.88 (s, 3H), 3.86 (s, 3H), 3.81 (s, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 163.1, 160.3, 157.8, 155.1, 152.6, 141.3, 140.0, 139.4, 123.2, 119.5, 113.5, 105.5, 103.0, 101.9, 96.4, 61.5, 61.4, 56.6, 56.5. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{19}\text{H}_{17}\text{O}_7$, 357.0969, found 357.0964.

3,8-Dimethoxy-6H-benzofuro[3,2-c]chromen-6-one (1q). 228.1 mg, 77.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 7.99 (d, J = 8.7 Hz, 1H), 7.80 (d, J = 9.0 Hz, 1H), 7.39 (s, 1H), 7.23 (s, 1H), 7.12 (dd, J = 12.5, 5.6 Hz, 2H), 3.96

(s, 3H), 3.91 (s, 3H). ^{13}C NMR (100 MHz, CDCl_3) δ 162.9, 161.2, 158.6, 157.6, 155.5, 149.9, 124.4, 122.8, 115.2, 113.1, 112.1, 106.1, 103.4, 101.4, 100.0, 56.0, 55.8. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{17}\text{H}_{13}\text{O}_5$, 297.0758, found 297.0756.

1,3,8,9-Tetramethoxy-6H-benzofuro[3,2-c]chromen-6-one (1r).^{3d} 131.8 mg, 37.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 7.51 (s, 1H), 7.31 (s, 1H), 6.76 (s, 1H), 6.64 (s, 1H), 4.00 (s, 3H), 3.88 (d, J = 6.3 Hz, 9H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 162.6, 160.1, 155.3, 145.7, 143.2, 143.1, 142.8, 142.0, 129.8, 122.4, 117.8, 113.3, 112.9, 110.2, 100.8, 61.3, 60.9, 56.8, 56.4. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{19}\text{H}_{17}\text{O}_7$, 357.0969, found 357.0965.

3,9-Dihydroxy-6H-benzofuro[3,2-c]chromen-6-one (coumestrol, 1s).^{5c} 1s was obtained from 2s following general procedure. 128.7 mg, 48.0% yield, white solid. Mp 361–364 °C. ^1H NMR (400 MHz, DMSO- d_6) δ 10.70 (s, 1H), 10.04 (s, 1H), 7.87 (d, J = 8.5 Hz, 1H), 7.70 (d, J = 8.4 Hz, 1H), 7.17 (d, J = 1.7 Hz, 1H), 7.01–6.86 (m, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 161.8, 159.9, 158.1, 157.5, 156.4, 155.1, 123.2, 121.1, 115.1, 114.5, 114.3, 104.6, 103.5, 102.5, 99.2. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{15}\text{H}_9\text{O}_5$, 269.0444, found 269.0446.

3-Hydroxy-9-methoxy-6H-benzofuro[3,2-c]chromen-6-one (9-methoxy-coumestrol, 1t).^{3d} 1t was obtained from 2t following general procedure. 177.8 mg, 63.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.76 (s, 1H), 7.87 (d, J = 8.6 Hz, 1H), 7.79 (d, J = 8.6 Hz, 1H), 7.50 (d, J = 2.1 Hz, 1H), 7.10 (dd, J = 8.6, 2.2 Hz, 1H), 7.02–6.88 (m, 2H), 3.87 (s, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 161.9, 160.5, 159.3, 158.0, 156.4, 155.3, 123.3, 121.0, 116.4, 114.3, 113.9, 104.6, 103.6, 102.4, 97.8, 56.4. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{16}\text{H}_{11}\text{O}_5$, 283.0601, found 283.0602.

3-Hydroxy-8,9-dimethoxy-6H-benzofuro[3,2-c]chromen-6-one (8,9-dimethoxy-coumestrol, 1u).^{3a} 1u was obtained from 2u following general procedure. 190.5 mg, 61.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.70 (s, 1H), 7.84 (d, J = 8.5 Hz, 1H), 7.55 (s, 1H), 7.33 (s, 1H), 7.05–6.83 (m, 2H), 3.87 (s, 6H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 161.6, 159.9, 158.1, 155.0, 149.8, 149.3, 148.2, 123.1, 115.1, 114.3, 104.7, 103.5, 102.7, 101.9, 97.2, 56.6, 56.4. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{17}\text{H}_{13}\text{O}_6$, 313.0707, found 313.0704.

3-Hydroxy-8,9-methylenedioxy-6H-benzofuro[3,2-c]chromen-6-one (medicagol, 1v).^{2g} 1v was obtained from 2v following general procedure. 106.6 mg, 36.0% yield, white solid. ^1H NMR (400 MHz, DMSO- d_6) δ 10.73 (s, 1H), 7.83 (dd, J = 8.5, 2.8 Hz, 1H), 7.56 (d, J = 3.3 Hz, 1H), 7.28 (d, J = 3.5 Hz, 1H), 6.92 (dd, J = 11.0, 5.1 Hz, 2H), 6.16 (s, 2H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 161.2, 159.8, 157.5, 154.5, 149.8, 146.9, 145.8, 122.6, 116.3, 113.8, 104.1, 103.0, 102.4, 102.1, 98.7, 94.7. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{16}\text{H}_9\text{O}_6$, 297.0394, found 297.0391.

3-Methoxy-8,9-methylenedioxy-6H-benzofuro[3,2-c]chromen-6-one (flemichapparin C, 1w).^{3a} 1w was obtained from 2w following general procedure. 152.0 mg, 49.0% yield, pale yellow solid. Mp 270–272 °C. ^1H NMR (400 MHz, DMSO- d_6) δ 7.92 (d, J = 8.5 Hz, 1H), 7.58 (s, 1H), 7.30 (s, 1H), 7.20 (s, 1H), 7.09 (d, J = 8.2 Hz, 1H), 6.16 (s, 2H), 3.90 (s, 3H). ^{13}C NMR (100 MHz, DMSO- d_6) δ 163.2, 160.6, 156.1, 155.9, 150.5, 147.9, 140.0, 137.7, 119.5, 114.4, 110.4, 103.7, 101.4, 98.3, 97.7, 92.5, 56.15. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{17}\text{H}_{11}\text{O}_6$, 311.0550, found 311.0550.

8,9,10-Trimethoxy-3-((methylthio)methoxy)-6H-benzofuro[3,2-c]chromen-6-one (1jj). 124.7 mg, 31.0% yield, pale yellow solid. ^1H NMR (400 MHz, $\text{DMSO}-d_6$) δ 8.03 (d, $J = 8.7$ Hz, 1H), 7.29 (d, $J = 2.3$ Hz, 1H), 7.16 (dd, $J = 8.7, 2.3$ Hz, 1H), 7.13 (s, 1H), 5.46 (s, 2H), 4.20 (s, 3H), 3.90 (s, 3H), 3.82 (s, 3H), 2.23 (s, 3H). ^{13}C NMR (100 MHz, $\text{DMSO}-d_6$) δ 160.6, 160.4, 157.9, 154.9, 152.7, 141.4, 140.2, 139.5, 123.3, 119.6, 114.9, 106.3, 104.2, 103.5, 96.6, 72.9, 61.5, 56.7, 14.4. HRMS-ESI (m/z): $[\text{M} + \text{H}]^+$ calculated for $\text{C}_{20}\text{H}_{19}\text{O}_7\text{S}$, 403.0846, found 403.0853.
