Accepted Manuscript

This is an *Accepted Manuscript*, which has been through the Royal Society of Chemistry peer review process and has been accepted for publication.

*Accepted Manuscripts* are published online shortly after acceptance, before technical editing, formatting and proof reading. Using this free service, authors can make their results available to the community, in citable form, before we publish the edited article. We will replace this *Accepted Manuscript* with the edited and formatted *Advance Article* as soon as it is available.

You can find more information about *Accepted Manuscripts* in the [Information for Authors](#).

Please note that technical editing may introduce minor changes to the text and/or graphics, which may alter content. The journal's standard [Terms & Conditions](#) and the [Ethical guidelines](#) still apply. In no event shall the Royal Society of Chemistry be held responsible for any errors or omissions in this *Accepted Manuscript* or any consequences arising from the use of any information it contains.

18 Abstract  
19

20 A porous hollow molecular imprinting polymer (MIPs) with ofloxacin (OFL) as  
21 template and SiO<sub>2</sub> nanoparticle (250 nm) as sacrifice core was synthesized. Dibutyl  
22 isophthalate was used as plasticizer to strengthen the polymer shell in MIP  
23 preparation firstly, which was necessary to avoid the shell broken. Infrared spectra (IR)  
24 and transmission electron microscope (TEM) were used to verify the successful  
25 synthesis of the hollow MIPs. The adsorption behavior of MIPs was evaluated by  
26 adsorption capacity, imprint factor and adsorption model. The MIPs could obtain the  
27 adsorption capacity of 147 mg g<sup>-1</sup> to OFL in theory and imprint factor of 2.6 when the  
28 initial OFL concentration was 900 µg mL<sup>-1</sup>. The MIPs could adsorb not only OFL but  
29 other fluoroquinolone antibiotics (FQs), which was useful to analyze FQs together. At  
30 the same time, it hardly adsorbed other compounds with dissimilar structure. The  
31 MIPs used as adsorbent to enrich the FQs from milk and the good selectivity and  
32 enrichment ratios were obtained. Coupling with high performance liquid  
33 chromatography (HPLC), the FQs in milk were determined with no more than 30 ng  
34 mL<sup>-1</sup> of the limit of quantitation (LOQ).

## Introduction

Fluoroquinolone antibiotics (FQs) are widely used as not only human but veterinary medicine in recent years. The residual FQs in edible animal's meat and milk will be adsorbed again by human and further cause pathogen resistance [1]. FQs are prohibited for use in food producing animals worldwide and their maximum residue limits in food must be less than  $100 \mu\text{g kg}^{-1}$  at least [2]. Milk is the common food especially for young children and it is very important to be sure its safety because the trace amount of antibiotics residue would be dangerous for the babies.

Nowadays, the residues of FQs in environment have aroused a concern. A lot of sensitive HPLC analytical methods to determine FQs are set up coupled with mass spectrometry detector [1,3], UV detector or diode array detector [4-5], fluorescence detector [6] or chemiluminescence detector [2]. However, the analysis of trace FQs in complicate matrix such as food still faces great challenge and the sample pretreatment is necessary.

For getting lower detection limit in the samples with complicate matrix, usually solid phase extraction (SPE), solid phase microextraction (SPME) and matrix solid-phase dispersion (SPD) [7-8] are preferred for enrichment and cleaning of samples. The molecular imprinting polymers (MIPs) are becoming the main sorbents for these techniques. For improving the selectivity or adsorption capacity, new types of MIPs are prepared continually with various methods. Besides the traditional precipitation polymerization [9], the electropolymerization [10], water compatible MIPs used to aqueous samples [11-13], metal ion mediated MIPs [14-15], surface MIPs on basic adsorbents such as silica [16] and mesoporous carbon [5], hollow porous MIPs [17,19] and MIPs with more than one functional monomers [20] are present recently. The sites left by template molecules are distributed homogeneously in the MIPs, it is difficult to use the innermost efficiently, which reduce the adsorption efficiency of MIPs and prolong the adsorption time. Hollow porous MIPs with thin shell make it possible to finish the adsorption in short time easily owing to the lower mass transfer resistance and the larger adsorption interface. Liu etc [17] prepared the hollow porous MIPs of bisphenol A using mesoporous MCM-48 nanospheres (about

1  
2  
3  
4 500 nm) [18] as the sacrificial support. The hollow MIPs of fenpropathrin were  
5  
6 prepared [19] with the size of 100  $\mu\text{m}$ . However, hollow MIPs were easy to be broken  
7  
8 during the usage and thick shell had to be made to avoid the breach, which was  
9  
10 conflicted with its advantages. Smaller particles used as sacrificial support could  
11  
12 make the MIPs own larger special surface to increase adsorption capacity and resist  
13  
14 pressure to avoid breach in the operation.

15  
16 In the paper, we synthesized a new hollow porous MIPs using ofloxacin (OFL)  
17  
18 as template molecules and further used the MIPs as SPE sorbent to determine the  
19  
20 trace FQs in milk coupling with HPLC method. The hollow MIPs had smaller core  
21  
22 compared with the literatures and achieved a nonbreakable thin shell owing to a  
23  
24 plasticizer used to enhance the mechanical strength of MIPs.

## 25 26 27 28 Experimental

### 29 30 Materials and reagents

31  
32 Tetraethoxysilane (TEOS), Methacrylic acid (MAA),  
33  
34 3-Methylacryloxypropyl-trimethoxysilane (MATMS) and Ethylene glycol  
35  
36 dimethacrylate (EGDMA) were purchased from Alfa Aesar (Beijing, China).  
37  
38 EGDMA was distilled before used. azo-bis-isobutyronitrile (AIBN) was obtained  
39  
40 from yuefeng chemical company(Tianjin, China). Dibutyl isophthalate (DBP) was  
41  
42 obtained from Beijing chemical factory (Beijing, China). Ofloxacin (OFL),  
43  
44 enrofloxacin (ENR), norfloxacin (NOR) and sulfamerazine (SMZ) were from  
45  
46 Shanghai Yuanye biology technique company (Shanghai, China). Ibuprofen (IBU)  
47  
48 was obtained from Hubei Baike Gelai Pharmaceutical Company (Wuhan, China).  
49  
50 Sudan I was purchased from Sinopharm Chemical Reagent Co. Ltd (Shanghai, China).  
51  
52 The solvents used including methanol, ethanol and acetonitrile (ACN) were distilled  
53  
54 before used. Acetic acid, triethylamine and hydrofluoric acid (HF) were used directly.  
55  
56 All the reagents were of analytical grade. Ultra pure water used throughout the  
57  
58 experiments was obtained from the MILLI-Q (Millipore, Bedford, MA, USA)  
59  
60 purification system. HPLC-grade methanol was from Dima Technology  
(RichmondHill, USA).

## Instrumental analysis

The chromatographic analytical system consisted of two Model 210 HPLC pumps and a UV detector (Varian Prostar, USA). All separations were carried out on a C18 column (Dikma Technologies, 5  $\mu\text{m}$ , 250 $\times$ 4.6 mm). Mobile phase was consisted of Methanol/phosphate buffer (0.01 mol/L, pH 2.80, v/v=25/75) and filtered by 0.45  $\mu\text{m}$  membrane. The rate was 1.0 mL min<sup>-1</sup> and column temperature was 40 °C. UV detection wavelength was changed as following: 0-14.8 min 293 nm; 14.8-25.0 min 277 nm. Injection volume was 10  $\mu\text{L}$ .

UV measurement was accomplished at Beijing Puxi TU-1810-UV spectrophotometer (Beijing, China). The Fourier transform infrared (FTIR) spectra were acquired with an FTIR spectrometer (Thermo Mattson, Madison, WI, USA). Transmission electron microscopy (TEM) was carried out by a JEM1200EX instrument (JEOL Tokyo, Japan).

## Preparation of MIPs

First, SiO<sub>2</sub> nanoparticles were synthesized and followed by surface modification of MIPs polymers with OFL as template molecules. Later, SiO<sub>2</sub> was etched by HF.

SiO<sub>2</sub> nanoparticles were synthesized according to the reference [21]. 860 mg of TEOS was resolved in 50 mL of ethanol and 1.0 mL of aqueous ammonia (25% concentrated ammonia in water) was added dropwise. The system was kept stirring at 25 °C for 4 h. After the deposit was centrifuged at 15000 rpm and washed with ethanol, it was dispersed in ethanol again and centrifuged at 4000 rpm to remove the larger particles. Finally, the SiO<sub>2</sub> nanoparticles were dried.

One gram of SiO<sub>2</sub> nanoparticles were dispersed in ethanol and 0.5 mL of MATMS was added. The reaction system was kept stirring for 24 h to get SiO<sub>2</sub>@MATMS at 25 °C. The product was dried under vacuum.

0.5 g of SiO<sub>2</sub>@MATMS, 0.1 mmol of OFL and 0.4 mmol of MAA were dispersed in 20 mL of ACN with stirring. The mixture was stirred for 8 h in ice bath for prepolymerization and then 2.0 mmol of EGDMA as crosslinker, 0.14 mmol of DBP as plasticizer and 0.12 mmol of AIBN as initiator were added. N<sub>2</sub> gas was passed into the mixture to drive O<sub>2</sub> away and then under N<sub>2</sub> protection the reaction was lasted

1  
2  
3  
4 for 24 h at 60 °C with stirring. The product was named as MIP1. The procedure was  
5  
6 repeated except adding DBP and the corresponding product was named as MIP1a.

7  
8 40% (v/v) HF aqueous solution was used to soak 100 mg of the above materials  
9  
10 completely. The mixture was with vortex for 15 min and kept static for another 2 h.  
11  
12 After centrifuged, the materials were washed with methanol and dried under vacuum.

13  
14 Finally, the hollow MIP particles were put into a column and washed with  
15  
16 methanol–acetic acid (4:1, v/v) to remove the template molecules, then dried under  
17  
18 vacuum at 40 °C and stored at ambient temperature before use.

19  
20 For comparison, several polymers including non molecular imprint polymers  
21  
22 (NIPs) were synthesized on the surface of SiO<sub>2</sub>. The reactant ratios were summarized  
23  
24 in table 1. The synthesis of hollow MIP was shown in Fig 1.

### 25 26 27 **(Table 1)**

### 28 29 30 **(Fig 1)**

31  
32 Adsorption experiments

33  
34 Static adsorption experiments

35  
36 Each 20 mg of MIPs or NIPs was added to 10 mL of ACN containing 100 or 500  
37  
38  $\mu\text{g mL}^{-1}$  of OFL. The mixture was shaken for 24 h at 25 °C followed by 9000 rpm of  
39  
40 centrifugation. The supernatant was filtered to measure the concentration of OFL with  
41  
42 UV spectrophotometry method at 300 nm. According to the results, the MIP2, which  
43  
44 possessed the largest adsorption capacity, was further studied.

45  
46 20 mg of MIP2 or NIP2 was added to 10 mL of ACN solution containing 20-900  
47  
48  $\mu\text{g mL}^{-1}$  of OFL. The adsorption experiments were accomplished as the above  
49  
50 procedures. The data of static absorption experiment were further processed according  
51  
52 to the Scatchard equation (1) [22] to estimate the binding parameters of MIP2.

53  
54 (1)

55  
56 Here Q is the amount of OFL bound to MIP2 at equilibrium,  $Q_{\text{max}}$  is the maximum  
57  
58 binding capacity,  $C_{\text{free}}$  is the equilibrium concentration of OFL and  $K_{\text{d}}$  is the  
59  
60 dissociation constant, respectively.

Adsorption kinetic studies

1  
2  
3  
4 Adsorption kinetic studies were carried out as following: 20 mg of MIP2 or NIP2  
5 was suspended in 10 mL of ACN containing 20, 200 or 1000  $\mu\text{g mL}^{-1}$  of OFL. The  
6 mixture was incubated at 25 °C with shaking. Eight samples were taken at defined  
7 time intervals (at 1, 2, 3, 5, 7, 9, 12 and 24 h, respectively). The residual  
8 concentrations of OFL were measured with UV spectrophotometry method.

#### 9 10 11 12 13 14 Selectivity evaluation and competitive adsorption

15  
16 First, 20 mg of MIP2 was equilibrated with 10 mL of ACN containing 100  $\mu\text{g}$   
17  $\text{mL}^{-1}$  of OFL, SMZ, sudan I or IBU respectively to evaluate the selectivity of MIP2.  
18 Second, 20 mg of MIP2 was put into the mixture containing each 100  $\mu\text{g mL}^{-1}$  of  
19 OFL, NOR, ENR and SMZ to evaluate the selectivity of MIPs and the competitive  
20 capacity of OFL. The samples were shaken for 2 h at 25 °C to facilitate the  
21 adsorption. The concentrations of free analytes were determined by UV  
22 spectrophotometry (for the solution containing single analyte) or HPLC-UV methods  
23 (for the mixture).

#### 32 33 34 35 36 37 Determination of real samples

38  
39 Milk samples were purchased from retail markets in Lanzhou, China. These  
40 samples were kept at 4 °C until analysis.

41  
42 Extraction of the FQs from 10 mL of spiked or original milk was carried out by  
43 adding 1.0 mL of ACN and 0.1 mL of HCl (5 mol  $\text{L}^{-1}$ ). The mixture was oscillated  
44 and centrifuged at 12,000 rpm for 10 min. The supernatant was collected and  
45 transferred to another 15 mL tube, and the residues were extracted again with 1.0 mL  
46 of ACN. The pooled extract was adjusted pH with NaOH and up to 10.0 mL with  $\text{H}_2\text{O}$ .  
47 20.0 mg of MIP2 was added and shaken for the further dispersive solid phase  
48 extraction for 15 min. After centrifugation, the analytes were eluted from the  
49 adsorbent and dried with  $\text{N}_2$ . The residue was resolved in 0.5 mL of mobile phase for  
50 HPLC analysis. For comparison, the milk was protein-deposited and concentrated to  
51 0.5 mL for direct analysis.

#### 71 72 73 74 75 76 77 78 79 80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 97 98 99 100 101 102 103 104 105 106 107 108 109 110 111 112 113 114 115 116 117 118 119 120 121 122 123 124 125 126 127 128 129 130 131 132 133 134 135 136 137 138 139 140 141 142 143 144 145 146 147 148 149 150 151 152 153 154 155 156 157 158 159 160 161 162 163 164 165 166 167 168 169 170 171 172 173 174 175 176 177 178 179 180 181 182 183 184 185 186 187 188 189 190 191 192 193 194 195 196 197 198 199 200 201 202 203 204 205 206 207 208 209 210 211 212 213 214 215 216 217 218 219 220 221 222 223 224 225 226 227 228 229 230 231 232 233 234 235 236 237 238 239 240 241 242 243 244 245 246 247 248 249 250 251 252 253 254 255 256 257 258 259 260 261 262 263 264 265 266 267 268 269 270 271 272 273 274 275 276 277 278 279 280 281 282 283 284 285 286 287 288 289 290 291 292 293 294 295 296 297 298 299 300 301 302 303 304 305 306 307 308 309 310 311 312 313 314 315 316 317 318 319 320 321 322 323 324 325 326 327 328 329 330 331 332 333 334 335 336 337 338 339 340 341 342 343 344 345 346 347 348 349 350 351 352 353 354 355 356 357 358 359 360 361 362 363 364 365 366 367 368 369 370 371 372 373 374 375 376 377 378 379 380 381 382 383 384 385 386 387 388 389 390 391 392 393 394 395 396 397 398 399 400 401 402 403 404 405 406 407 408 409 410 411 412 413 414 415 416 417 418 419 420 421 422 423 424 425 426 427 428 429 430 431 432 433 434 435 436 437 438 439 440 441 442 443 444 445 446 447 448 449 450 451 452 453 454 455 456 457 458 459 460 461 462 463 464 465 466 467 468 469 470 471 472 473 474 475 476 477 478 479 480 481 482 483 484 485 486 487 488 489 490 491 492 493 494 495 496 497 498 499 500 501 502 503 504 505 506 507 508 509 510 511 512 513 514 515 516 517 518 519 520 521 522 523 524 525 526 527 528 529 530 531 532 533 534 535 536 537 538 539 540 541 542 543 544 545 546 547 548 549 550 551 552 553 554 555 556 557 558 559 560 561 562 563 564 565 566 567 568 569 570 571 572 573 574 575 576 577 578 579 580 581 582 583 584 585 586 587 588 589 590 591 592 593 594 595 596 597 598 599 600 601 602 603 604 605 606 607 608 609 610 611 612 613 614 615 616 617 618 619 620 621 622 623 624 625 626 627 628 629 630 631 632 633 634 635 636 637 638 639 640 641 642 643 644 645 646 647 648 649 650 651 652 653 654 655 656 657 658 659 660 661 662 663 664 665 666 667 668 669 670 671 672 673 674 675 676 677 678 679 680 681 682 683 684 685 686 687 688 689 690 691 692 693 694 695 696 697 698 699 700 701 702 703 704 705 706 707 708 709 710 711 712 713 714 715 716 717 718 719 720 721 722 723 724 725 726 727 728 729 730 731 732 733 734 735 736 737 738 739 740 741 742 743 744 745 746 747 748 749 750 751 752 753 754 755 756 757 758 759 760 761 762 763 764 765 766 767 768 769 770 771 772 773 774 775 776 777 778 779 780 781 782 783 784 785 786 787 788 789 790 791 792 793 794 795 796 797 798 799 800 801 802 803 804 805 806 807 808 809 810 811 812 813 814 815 816 817 818 819 820 821 822 823 824 825 826 827 828 829 830 831 832 833 834 835 836 837 838 839 840 841 842 843 844 845 846 847 848 849 850 851 852 853 854 855 856 857 858 859 860 861 862 863 864 865 866 867 868 869 870 871 872 873 874 875 876 877 878 879 880 881 882 883 884 885 886 887 888 889 890 891 892 893 894 895 896 897 898 899 900 901 902 903 904 905 906 907 908 909 910 911 912 913 914 915 916 917 918 919 920 921 922 923 924 925 926 927 928 929 930 931 932 933 934 935 936 937 938 939 940 941 942 943 944 945 946 947 948 949 950 951 952 953 954 955 956 957 958 959 960 961 962 963 964 965 966 967 968 969 970 971 972 973 974 975 976 977 978 979 980 981 982 983 984 985 986 987 988 989 990 991 992 993 994 995 996 997 998 999 1000

#### Characterization

1  
2  
3  
4 The materials were observed with TEM (Fig 2). We got the regular SiO<sub>2</sub> particles  
5 with size of about 250 nm (a). The polymer layer could be found to cause the  
6 conglutination of particles (b). The hollow polymers particles with DBP adding were  
7 holonomic with the layer thickness of about 70 nm (c) but the particles broken  
8 without adding DBP (d). DBP was one of the most used plasticizer, which could  
9 increase flexibility and extensibility of the polymer. Because keeping the particle  
10 shape was necessary for the reproducibility and stability of extraction, all the MIPs  
11 without adding DBP would not be used further.

### 12 (Fig 2)

13  
14 The materials with DBP and SiO<sub>2</sub> particles were certified with IR spectra, shown  
15 in fig 3. The IR spectrum of SiO<sub>2</sub> particles was shown in (a). 468 and 800 cm<sup>-1</sup> were  
16 the symmetric stretching peaks and 1100 cm<sup>-1</sup> was the anti-symmetric stretching peak  
17 of Si-O-Si. 957 cm<sup>-1</sup> was the bending vibration peak of Si-OH. (b) belonged to SiO<sub>2</sub>  
18 -MIP2 in which 1734 cm<sup>-1</sup> was the special peak of C=O from DBP, MATMS and  
19 EGDMA; 758 ,879 and 957 cm<sup>-1</sup> belonged to substituted benzene ring in DBP; 2960  
20 and 2991 cm<sup>-1</sup> were from -CH<sub>2</sub> group. The reduced strength of 1100 cm<sup>-1</sup> verified the  
21 successful modification of MIP2 on SiO<sub>2</sub>. (c) and (d) were from hollow MIP2 and  
22 NIP2, respectively. It was found the special peaks of SiO<sub>2</sub> disappeared after SiO<sub>2</sub> was  
23 etched and the in-plane bending vibration peak of -OH group (1258 cm<sup>-1</sup>) and the  
24 stretching vibration peak of C-O group (1159 cm<sup>-1</sup>) became distinct without the  
25 disturbance of SiO<sub>2</sub>.

### 26 (Fig 3)

#### 27 Adsorption evaluation

28 The adsorption capacity Q (the adsorption amount (mg) of OFL on 1.0 g  
29 materials) and imprint factors  $\alpha$  of the hollow MIPs (the ratio of OFL adsorption  
30 amount on MIP and NIP under same conditions) were compared each other at initial  
31 concentrations of 100 and 500  $\mu\text{g mL}^{-1}$  of OFL. The results were shown in table 2.

### 32 (Table 2)

33 Q<sub>MIP2</sub> and Q<sub>MIP3</sub> was similar each other under the same conditions and always  
34 higher than Q<sub>MIP1</sub>. The imprint factors  $\alpha$  from different MIPs were higher than 1

1  
2  
3  
4 under any condition studied with the similar values, which meant MIPs had higher  
5 adsorption capacities than corresponding NIPs. Increasing the polymer thickness was  
6 helpful to increase adsorption capacity. But when the layer thickness was increased so  
7 much, the adsorption capacity was not continue increase, owing to lower mass  
8 transfer and adsorption efficiency resulting from hidden adsorption sites. In addition,  
9 the site of template molecules was not increased in direct proportion with polymer  
10 thickness. So MIP3 could not display better properties than MIP2. At last MIP2 was  
11 chosen for further experiments.  
12  
13  
14  
15  
16  
17  
18

19  
20 The adsorption capacities of MIP2 and NIP2 were further compared in samples  
21 with different OFL concentrations (Fig 4). When the initial concentration of OFL was  
22 higher than  $300 \mu\text{g mL}^{-1}$ , the adsorption capacity of MIP2 was becoming much higher  
23 than of NIP2. NIP2 got the adsorption capacity of  $27.0 \text{ mg g}^{-1}$  and the adsorption  
24 capacity of MIP2 could not get the constant yet in the experimental scope. The  
25 samples with higher concentrations of OFL did not be studied because of the limit of  
26 solubility of OFL. When the initial concentration of OFL was  $900 \mu\text{g mL}^{-1}$ , the  
27 imprint factor  $\alpha$  was about 2.6. Scatchard curve was set up according to the  
28 experimental results of MIP2. The two distinct linear portions were obtained, which  
29 meant two kinds of adsorption sites existing in MIP2. One was with higher adsorption  
30 selectivity, the corresponding  $K_{d1}$  and  $Q_{\text{max}1}$  was  $2.342 \text{ mmol L}^{-1}$  and  $0.133 \text{ mmol}$   
31  $\text{g}^{-1}$ . Another one was with low adsorption selectivity, the  $K_{d2}$  and  $Q_{\text{max}2}$  was  $0.459$   
32  $\text{mmol L}^{-1}$  and  $0.274 \text{ mmol g}^{-1}$ , respectively. The maximal adsorption capacity would  
33 be  $147 \text{ mg g}^{-1}$  in theory, which was larger than the values obtained from the other  
34 hollow MIPs reported in literatures [17,19]. Langmuir and Freundlich adsorption  
35 isotherm equations were used to analyze the sorption equilibrium and the correlation  
36 coefficient  $R^2$  for Langmuir equation was 0.9739, which was smaller than that from  
37 Freundlich equation ( $R^2=0.9910$ ). It could be deduced that OFL molecules were  
38 adsorbed on heterogeneous sites of MIP2 with a non-uniform distribution of energy  
39 levels [23]. The results from Scatchard curve and Freundlich equation were  
40 concordant with each other.

58  
59  
60

(Fig 4)

1  
2  
3  
4 The adsorption time up to the equilibrium depended on the initial OFL  
5 concentration seriously in the dynamic experiments (Fig 5). The larger initial  
6 concentration of OFL, the longer equilibrium time was. When OFL concentration was  
7  $20 \mu\text{g mL}^{-1}$ , the equilibrium was gotten within 30 min. Under the same conditions, it  
8 needed 60 min for the MIPs prepared with precipitation polymerization (the data were  
9 not shown, which was accepted by Journal of Lanzhou University (natural sciences)).  
10 But the equilibrium needed 9 h to get in  $1000 \mu\text{g mL}^{-1}$  of OFL sample. In addition,  
11 MIP2 needed longer time than NIP2 to get equilibrium because it contained the deep  
12 caves left by template molecules. The pseudo-first-order kinetic model and the  
13 pseudo-second-order kinetic model [23] were used to study the adsorption data too. It  
14 was found the kinetic data fit pseudo-first-order format better than  
15 pseudo-second-order format with the  $R^2$  larger than 0.97. The calculated  $Q_{\text{max}}$  of MIP2  
16 was  $109.3 \text{ mg g}^{-1}$ , which was smaller than the value from Freundlich equation ( $147$   
17  $\text{mg g}^{-1}$ ). Even though the shell layer of MIP2 was thin enough, the resistance of mass  
18 transfer was still existed to decrease the adsorption capacity.

### 33 (Fig 5)

#### 34 Selectivity and competitive adsorption

35  
36 The selectivity of MIP2 was evaluated by two experiments. The results were  
37 shown in fig 6. MIP2 showed very low adsorption capacity to SMZ, IBU and sudan I as  
38 expected because of their dissimilar structures with OFL. The adsorption capacity of  
39 MIP2 to OFL was about 16 times more than to SMZ and IBU, and eight times more than  
40 to Sudan I. MIP2 displayed higher adsorption capacity to OFL and NOR because of their  
41 similar structures and a little higher imprint factor for OFL. MIP2 did not show the  
42 satisfied adsorption capacity for another FQ molecule - ENR. The possible reason was  
43 that the three-membered ring of ENR was rigid body and it was difficult to enter the sites  
44 left by OFL in MIP2. The adsorption capacity of MIP2 to OFL decreased in the mixture  
45 containing the similar molecules. The total adsorption amount of MIP2 for OFL and NOR  
46 in the mixture was nearly equal to the adsorption amount of OFL in the pure OFL  
47 solution.  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

NIP2 displayed higher adsorption capacity to OFL and NOR too. The possible

1  
2  
3  
4 reason was hydrogen bonding existed as the main interaction force between analytes and  
5  
6 the materials because of the FQs containing the element F. Owing to the rigid ring existed  
7  
8 in ENR molecule, it might be difficult to get the suitable angle to form hydrogen bonding.

9  
10 **(Fig 6)**

11 Sample analysis

12  
13  
14 Optimal conditions of adsorption and desorption

15  
16 First, pH (2.0-7.0) of milk sample was adjusted. Satisfied recovery ratio was  
17  
18 obtained when sample pH was 3.0 to 4.0, the possible reason may be that interaction  
19  
20 between the residual casein (the main protein in milk, pI 4.6) and OFL (pKa 5.49) was  
21  
22 relatively weak in such a pH scope. Lower pH would change the surface property of  
23  
24 MIP and the charge distribution of OFL, which made the recovery lower.

25  
26 Second, the ion strength of milk was adjusted by adding NaCl to the sample. It  
27  
28 was found that adding NaCl could decrease the recovery.

29  
30 Third, the mixture of acetic acid and methanol or ACN (v/v, 10/90) was used to  
31  
32 desorb OFL from the MIP2. It was found that methanol mixture offered higher  
33  
34 recovery. Then the volume of acetic acid-methanol mixture was optimized (0.5, 1.0,  
35  
36 1.5, 2.0, 2.5 and 3.0 mL). 2.0 mL was chosen to elute OFL from 20 mg of MIP2.

37  
38 Analysis method

39  
40 HPLC–UV method was set up for determination of FQs in milk. Under the  
41  
42 optimal conditions, the method performance was evaluated in the linear range of  
43  
44  $0.03\text{--}2.5\ \mu\text{g mL}^{-1}$  ( $R^2 > 0.9994$ ) in milk and  $0.03\ \mu\text{g mL}^{-1}$  was affirmed as the limit of  
45  
46 quantitation (LOQ) for the ENR and  $0.02\ \mu\text{g mL}^{-1}$  for OFL and NOR (signal/noise=6).  
47  
48 The accuracy and repeatability of this method were also evaluated by recoveries of  
49  
50 spiked milk at  $0.0625$ ,  $0.5$  and  $1.0\ \mu\text{g mL}^{-1}$ . The results were shown in table 3.

51  
52 **(Table 3)**

53  
54 Fig 7 was the chromatograms of blank milk (a) and spiked milk with  $62.5\ \text{ng mL}^{-1}$   
55  
56 FQs (b) after treatment with MIP2. No FQs were found in non-spiked milk  
57  
58 samples. Fig 8 was the chromatograms of the spiked milk with FQs ( $125\ \text{ng mL}^{-1}$ ),  
59  
60 without (a) or with (b) MIP2 treatment. The effect of MIP2 treatment was distinct for  
cleaning the sample. Without MIP2 treatment, the peaks of OFL and NOR could not

1  
2  
3  
4 be identified and lower than the LOQs, and all the peaks of FQs were disturbed with  
5 interferences, especially ENR (a). After treated with MIP2, the peaks OFL and NOR  
6 increased distinctly (b). The interferences, which disturbed the ENR peak, were  
7 eliminated because they were not adsorbed on MIP2 and the pure peak was obtained.  
8  
9

10  
11  
12 **(Fig 7)**

13  
14 **(Fig 8)**

15  
16 Conclusion

17  
18 A new kind of hollow MIPs nanoparticles of OFL was prepared. DBP was added  
19 in the MIP synthesis procedure for the first time to avoid the particles broken. The  
20 new material offered faster adsorption rate than prepared by precipitation  
21 polymerization and the higher adsorption capacity than the other hollow MIPs  
22 reported with larger sizes and thicker shells. The MIPs could enrich OFL and reduce  
23 the interference efficiently in milk samples.

Table 1 Various materials synthesized in the work

SiO <sub>2</sub> @MATM S (g)	OFL (mmol)	MAA (mmol)	EGDMA (mmol)	DBP (mmol)	AIBN (mmol)	Name of polymer
0.5	0.1	0.4	2.0	0.14	0.12	MIP1
0.5	0	0.4	2.0	0.14	0.12	NIP1
0.5	0.1	0.4	2.0	0	0.12	MIP1a
0.5	0.1	0.8	4.0	0.28	0.12	MIP2
0.5	0	0.8	4.0	0.28	0.12	NIP2
0.5	0.1	0.8	4.0	0	0.12	MIP2a
0.5	0.1	1.2	6.0	0.42	0.12	MIP3
0.5	0	1.2	6.0	0.42	0.12	NIP3
0.5	0.1	1.2	6.0	0	0.12	MIP3a

Table 2 Adsorption capacities and imprint factors of materials

	100 µg/mL OFL			500 µg/mL OFL		
	Q <sub>MIP</sub> (mg g <sup>-1</sup> )	Q <sub>NIP</sub> (mg g <sup>-1</sup> )	α	Q <sub>MIP</sub> (mg g <sup>-1</sup> )	Q <sub>NIP</sub> (mg g <sup>-1</sup> )	α
1*	11.73	7.56	1.55	27.44	18.97	1.44
2	16.31	10.6	1.54	36.82	26.95	1.36
3	15.22	9.97	1.53	32.60	24.57	1.32

\*1, 2 or 3 meant the number in the name of MIP or NIP. n=3

Table 3 Recoveries and RSDs of SPE-HPLC method for milk samples

added <sup>a</sup>		OFL	NOR	ENR
0.0625	Recoveries (%)	97.6	97.7	98.4
	RSD% <sup>1</sup>	4.2	4.9	4.7
	RSD% <sup>2</sup>	3.5	4.1	1.4
0.5	Recoveries (%)	102.6	93.7	90.9
	RSD% <sup>1</sup>	2.9	3.0	3.7
	RSD% <sup>2</sup>	3.6	4.8	4.3
1.0	Recoveries (%)	101.8	98.9	102.1
	RSD% <sup>1</sup>	3.9	1.4	2.6
	RSD% <sup>2</sup>	2.5	2.8	4.8

<sup>a</sup> added concentration:  $\mu\text{g/mL}$  ; <sup>1</sup> intraday RSD%; <sup>2</sup> interday RSD%. n=3

## Captions

Fig1 Synthesis route of hollow MIPs

Fig2 TEM of materials

(a) SiO<sub>2</sub> nanoparticles; (b) SiO<sub>2</sub> coated with MIP2; (c) hollow MIP2; (d) hollow MIP2a. All the bars in the pictures mean 200 nm.

Fig3 IR spectra of materials

(a) SiO<sub>2</sub>; (b) SiO<sub>2</sub> coated with MIP2; (c) hollow MIP2; (d) hollow NIP2

Fig4 Adsorption isotherm of MIP2 and NIP2 (a) and Scatchard curves of MIP 2 (b)

Conditions: 20 mg of MIP2 or NIP2; 10 mL of ACN solution with different concentration of OFL; adsorption time: 24 h. temperature: 25 °C

Fig5 Adsorption kinetic curves of MIP2 and NIP2

Conditions: 20 mg of MIP2 or NIP2; 10 mL of ACN solution with 20, 200 or 1000 µg mL<sup>-1</sup> of OFL; temperature: 25 °C.

Fig6 Adsorption amounts of different compounds on MIP2

Conditions: 20 mg MIP2; 10 mL of ACN containing 100 µg mL<sup>-1</sup> OFL or SMZ, sudan I and IBU, respectively (a); 10 mL of ACN containing OFL, NOR, ENR and SMZ with each 100 µg mL<sup>-1</sup> (b).

Fig7 Chromatograms of blank and spiked milk samples

Blank milk sample (a); Milk sample spiked with 62.5 ng mL<sup>-1</sup> of OFL, NOR and ENR (b).

Conditions: 10 mL of milk, treated with 20 mg of MIP2; final volume after treatment: 0.5 mL;

Chromatographic conditions: C18 column, Methanol/phosphate buffer (0.01 mol/L, pH 2.80,

v/v=25/75), flow rate: 1.0 mL min<sup>-1</sup>, column temperature :40 °C. UV detection wavelengths:

0-14.8 min, 293 nm; 14.8-25.0 min, 277 nm; Injection volume: 10 µL. Peak 1, OFL; Peak 2, NOR;

Peak 3, ENR.

Fig8 Chromatograms of milk samples spiked with 125 ng mL<sup>-1</sup> of three FQs

Conditions: milk sample was protein-deposited and concentrated directly to 0.5 mL (a); milk

sample was further treated with MIP2 after protein-deposited (b).

The treatment conditions and the chromatographic conditions: same as Fig 7.

Fig 4

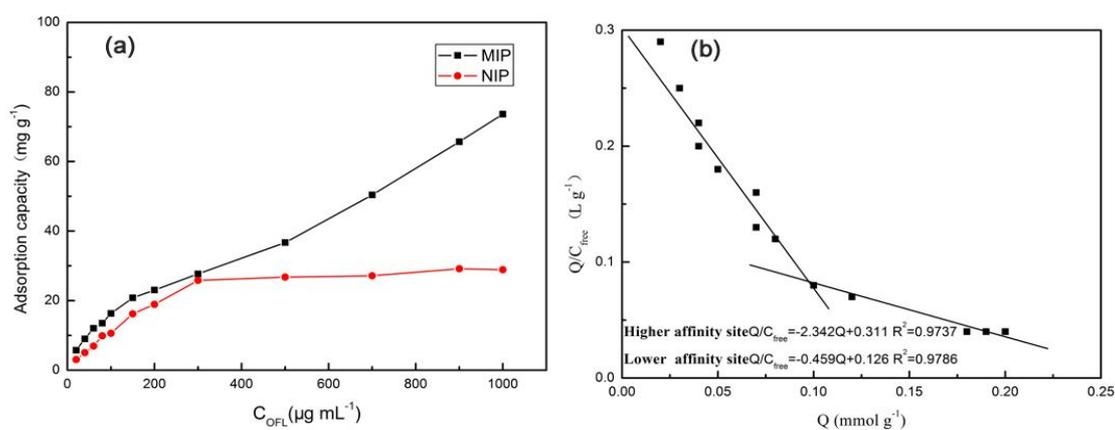

Fig4 Adsorption isotherm of MIP2 and NIP2 (a) and Scatchard curves of MIP 2 (b)

Conditions: 20 mg of MIP2 or NIP2; 10 mL of ACN solution with different concentration of OFL;

adsorption time: 24 h. temperature: 25 °C

Fig 5

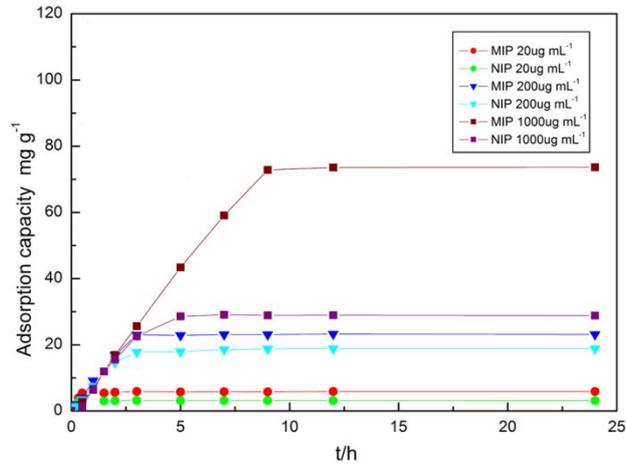

Fig5 Adsorption kinetic curves of MIP2 and NIP2

Conditions: 20 mg of MIP2 or NIP2; 10 mL of ACN solution with 20, 200 or 1000  $\mu\text{g mL}^{-1}$  of OFL; temperature: 25  $^{\circ}\text{C}$ .

Fig 6

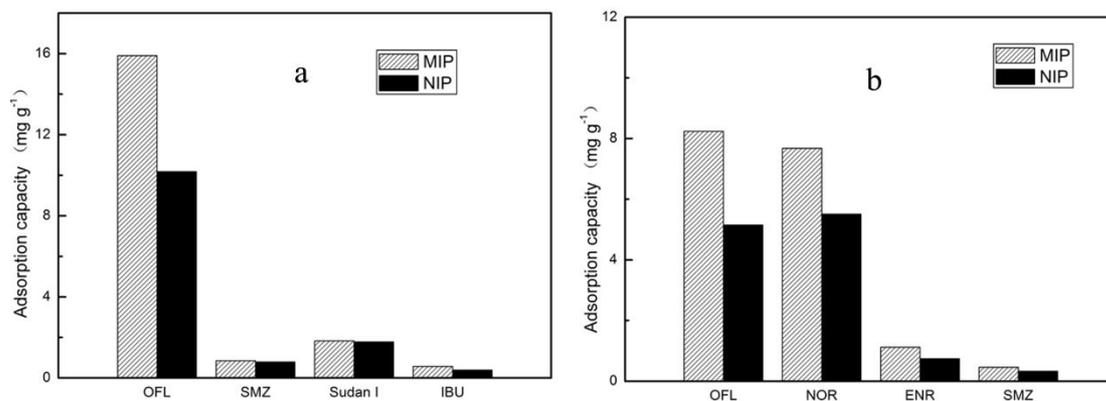

Fig6 Adsorption amounts of different compounds on MIP2

Conditions: 20 mg MIP2; 10 mL of ACN containing 100  $\mu\text{g mL}^{-1}$  OFL or SMZ, sudan I and IBU, respectively (a); 10 mL of ACN containing OFL, NOR, ENR and SMZ with each 100  $\mu\text{g mL}^{-1}$  (b).

Fig 7

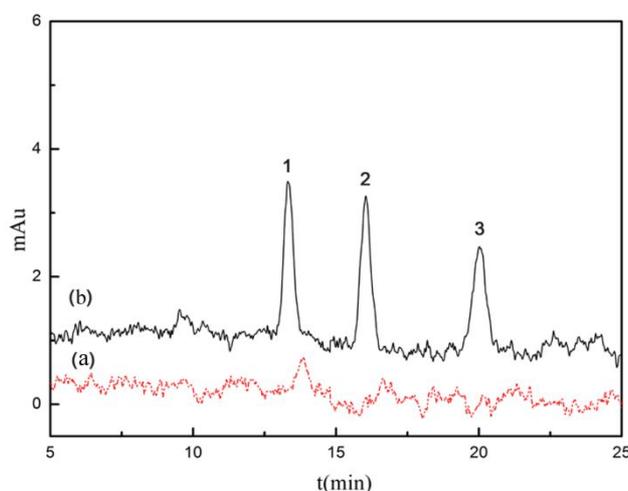

Fig7 Chromatograms of blank and spiked milk samples

Blank milk sample (a); Milk sample spiked with  $62.5 \text{ ng mL}^{-1}$  of OFL, NOR and ENR (b).

Conditions: 10 mL of milk, treated with 20 mg of MIP2; final volume after treatment: 0.5 mL;

Chromatographic conditions: C18 column, Methanol/phosphate buffer (0.01 mol/L, pH 2.80,

$v/v=25/75$ ), flow rate:  $1.0 \text{ mL min}^{-1}$ , column temperature:  $40 \text{ }^\circ\text{C}$ . UV detection wavelengths:

0-14.8 min, 293 nm; 14.8-25.0 min, 277 nm; Injection volume:  $10 \text{ } \mu\text{L}$ . Peak 1, OFL; Peak 2, NOR;

Peak 3, ENR.

Fig 8

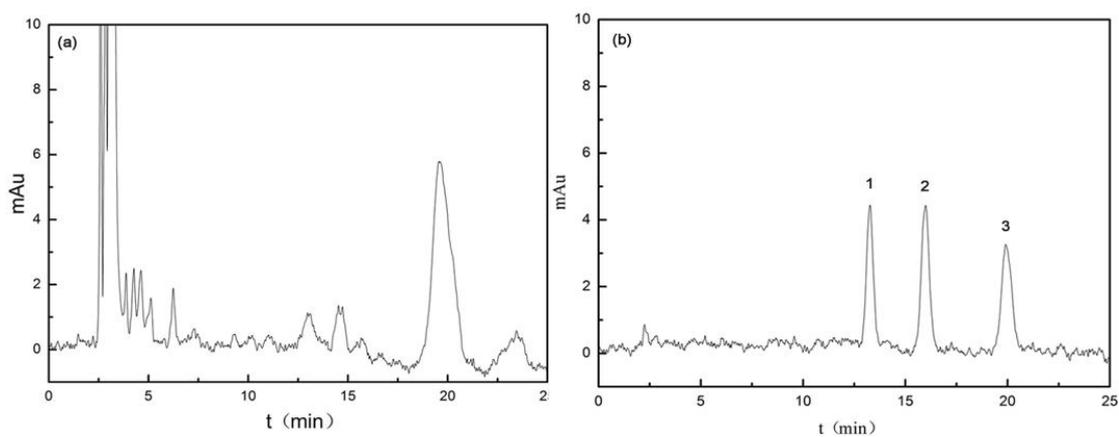

Fig8 Chromatograms of milk samples spiked with  $125 \text{ ng mL}^{-1}$  of three FQs

Conditions: milk sample was protein-deposited and concentrated directly to 0.5 mL (a); milk sample was further treated with MIP2 after protein-deposited (b).

The treatment conditions and the chromatography conditions: same as Fig 7.
